Exhibit 10

Vinson et al Dovepress

At the present time, there is only one nonprescription nutraceutical product that is currently under investigation (Pharmachem Laboratory, Phase II) and is approved by the US Food and Drug Administration, with a quali ed health claim for assistance in weight control and a structure-function claim for its mechanism, which is that it blocks starch absorption by means of an

high-dose sequence (n4), or placebo/high-dose/low-doseThe statistical analyses report the test statisticalue. sequence (n46). Subjects stayed on a treatment for a period on the mean data reported in Tablehere were statistion of 6 weeks, followed by a 2-week washout period, before thosely significant reductions in weight, BMI, percent body next treatment period began.

fat, and heart rate after consuming GCA for two-thirds of

Subjects were examined at weeks 0, 6, 8, 14, 16, and the 22-week crossover study, but there was no overall sigof the study. Subjects were examined individually at Trinitini cant change in systolic or diastolic blood pressure. The Hospital, Bangalore, India. During each visit, the following mean values on all measures at the beginning and end of measurements were taken: body weight to nearestko,01 each treatment arm (high-dose, low-dose, placebo) assessed height to nearest 0.0cm, and a body fat percentage analysifor all 16 subjects, are displayed in Tal2eThe data show using a SFB7 Bioimpedance device. BMI was determined reduction in weight, BMI, and percent body fat in the using the formula of BM= weight in kg divided by the high-dose and low-dose arms, but not the placebo arm, and square of the height in meters. All subjects were counseladeduction in heart rate in the high-dose arm, but not the for diet and exercise compliance at every visit, with the initiabw-dose and placebo arms. Figureshows the mean weight interview to establish diet details at the start of the study donbeange across the 22-week study for each of the three groups, by the site nutritionist. Data gathered included daily calorized Figure shows the mean change in BMI. A three-way intake, nutrient composition, micronutrient intake, and incirepeated-measures analysis of variance (factor 1: sequence dence of binge eating (see Table or average diet intake [high-dose/low-dose/placebo versus low-dose/placebo/highinformation). The same procedure was repeated at the begins eversus placebo/high-dose/low-dose]; arm [rst versus ning of each cycle to re ect the diet during the previous cyclsecond versus third treatment]; and time [two evaluations]) and subjects underwent pre- and post-assessment systolic am the data from all 1 subjects who were randomized into diastolic blood pressure and heart rate measurements, at expectors over design was conducted on each of the primary visit. Blood pressure was measured in the right forearm of toome measures (weight, BMI, and percent body fat), as the subject in a sitting position after a 10-minute rest usinvell as diastolic blood pressure, systolic blood pressure, a standard mercury sphygmomanometer. and heart rate.

Statistical analysis

Primary outcome measures

The primary measures in this study were weight, BMI, anothere was a signi cant treatment arm effect for weight body fat percentage; however, heart rate and blood press(Pe 0.001), BMI (P 0.001), and percent body fat taken at each visit were also analyzed. Statistical analys(Ps 0.001), showing an improvement in each measure over were carried out with a repeated-measures analysis of value course of the study. There was a signi cant time effect for ance and post hotetests. Factors for the analysis of vari-weight (P 0.001), BMI (P 0.001), and percent body fat ance were sequence (high-dose/low-dose/placebo vers(Ps 0.001), showing an improvement between the beginning low-dose/placebo/high-dose versus placebo/high-dose(mid end for each arm. There was no signi cant difference low-dose), treatment arm (rst versus second versus thibothere the three sequences (P 0.373). treatment), and time (two evaluations per treatment arm). The sequence arm interaction was significant for For the time factor, the rst evaluation within each treatweight (P 0.004), BMI (P 0.004), and percent body ment arm (weeks 0, 8, 16) was considered a pretreatment entities (P 0.002), indicating an overall difference in the arms evaluation, and the second evaluation within each treatmentors the three sequences, ie, a differential in uence of arm (weeks 6, 14, 22) was a post-treatment evaluationerach arm on each sequence. The atime interaction was

signi cant for weight (P 0.001), BMI (P 0.001), and Most importantly, the triple interaction was signi cant for percent body fat (P 0.03), indicating overall drug effects. weight (P 0.001) and BMI (P 0.001), but not for percent This can be seen in Tab2ewhere there were improvements body fat (P=0.239). For weight, the 2.042.20kg decrease in the in weight, BMI, and percent body fat in the high-dose and high-dose arm was greater than the @.3441kg increase in the low-dose arms, but not the placebo arm. For weight, the tacebo arm (P 0.013), and the 1.5 ± 1.74 kg decrease in 2.04± 2.20kg decrease in the high-dose arm was signi carthe low-dose arm was greater than the £.841kg increase in 0.003), as was the 1.541.74kg decrease in the low- the placebo arm (P 0.001). The change in weight in the highdose arm (P 0.005); but the 0.34± 1.41kg change in the dose arm was not different from the change in weight in the lowplacebo arm was not signi cant (₱0.355). For BMI, the dose arm (₱0.544). For BMI, the 0.744 0.80kg/m² decrease 0.74± 0.80kg/m² decrease in the high-dose arm was signi Td [(Td [235(e6(d)1878pTJ -TJ /Span <</ActualText (þÿ 35(e6(d)1878pT cant (P 0.003), assTv2aisxtt/(ey/0.)\$808662q7/or/2019d1/92485T261 [(Td [(T0kg.n)69TT0J - -93v0e)42 Tc -4 304.725T23d [(Td [(Td Vital m the low-dose arm (P 0.004); but the- 0.12 ± 0.51 kg/m² change in the placebo arm was not signi can (₱.384). For percent body fat, the 1.19%1.22% decrease in the high-dose arm was signi cant (P 0.002), as was the $1.06\% \pm 1.12\%$ decrease in the low-dose arm (P0.003); surprisingly, the decrease was also signi cant in the placebo arm 0.88%± 1.26% (P= 0.015). The sequencetime interaction was marginally nonsigni cant for weight, #P0.08), was marginally signi cant for BMI (P= 0.049), and was

signi cant for percent body fat (P 0.001).

pressure, diastolic blood pressure). For heart rate, there was a marginally nonsigni cant sequence effect (θ .065), and arm×time interaction (θ .0083). The only signi cant result was a time effect (θ .0007), re ecting an improvement between the beginning and end for each arm. No other effect was signi cant (θ .0.165). There were no signi cant results

Vinson et al Dovepress

activated receptor. This is one of the key regulators of lipids and glucose.

There have been a few human studies with greffie extract. Thom investigated the ef cacy and tolerability of a green coffee extract (Sven) ladded to instant coffee and compared within a randomized, placebo-controlled, double-blind study?! The product reduces the absorption of different types of sugar from the gastroint estinal tract.
