3	INTRODUCTION AND WELCOMING REMARKS
4	MR. MOORE: Good morning. Welcome to day three
5	of our hearing sessions on antitrust and multi-sided
6	platforms. We have a great and full day for all of you
7	in the audience and watching on the web.
8	Just to put today's events in a little bit of
9	context, on Monday, the first day, we heard quite a bit
10	about the economics of multi-sided platforms, and we
11	also heard about individuals' experiences operating
12	multi-sided platforms and investing in multi-sided
13	platforms in the business world. And we also heard
14	about how to define relevant markets and think about
15	market power from an antitrust perspective.
16	Yesterday, we heard about the United States vs.
17	Microsoft case, a protoplatform case. That case was
18	litigated and decided before much of the new economic
19	learning on multi-sided platforms had taken place. And
20	we also heard about how the U.S. and European
21	competition agencies might treat cases involving
22	multi-sided platforms differently.
23	Today is all about conduct, and when I say
24	"conduct," I'm using the term quite broadly. I'm
25	thinking both about anticompetitive conduct by a single

- 1 firm and also about mergers and acquisitions. So in 2 the morning sessions, we have two panels on potential 3 exclusionary conduct cases involving multi-sided 4 platforms as defendants. 5 The first panel, which will take place in just 6 a few moments, is going to focus on specific pieces of 7 potential anticompetitive conduct. The second panel is 8 going to focus on how vertically integrated platforms 9 might be able to engage in potential exclusionary 10 conduct. 11 We have three afternoon sessions devoted to the 12 timely topic of how to think about mergers and 13 acquisitions involving multi-sided platforms, 14 particularly when the acquiring company is a large and 15 established multi-sided platform. 16 So with a broad overview of where we're going 17 today and how that fits into what we've done so far, I 18 will turn the mic over to my colleague, Ian Conner, who 19 is going to moderate our first panel. 20 21 22 23 24
- 25

Professor of Law, specializing in competition law at
the University of Leeds in the United Kingdom.
We will start with opening statements from each
of the panelists and then turn to questions. So I will
turn first to Dick Schmalensee for his opening
statement.
MR. SCHMALENSEE: Thank you. Let me just make
a few general remarks.
First, I think it's important to be clear what
we're talking about. The definition of "platforms" is
sometimes a little vague. I really mean a business
that facilitates interactions between members of two
distinct groups, and when that's a viable business,
there are inevitably indirect network effects, network
externalities, connecting the members of those two
groups. If you can make a business out of facilitating
interactions, they must care about the folks in the
other group. That's indirect network effects.
When multi-sidedness is present, it is hard to
imagine, in antitrust analysis, why it wouldn't be
considered perhaps not modeled explicitly, perhaps
put to one side but if it's an important feature
that affects business conduct, like scale economies or
intellectual property, it's hard to make a case for
ignoring it. And I take this to be the primary lesson,

1	The dissent almost seemed to say you suppressed
2	competition, that's illegal, and I wonder what would
3	have happened if Diner's Club had had the nonsteering
4	rule that American Express had had.
5	Thank you.
6	MR. CONNER: So next we will turn to Tom Brown.
7	MR. BROWN: Thank you, Ian, and thank you,
8	Dick, for the introduction to this wonderful topic, and
9	I actually want to thank the FTC and my former
10	colleague, Bilal Sayyed, for inviting me, having spent
11	the last couple of days sort of reviewing all the
12	amazing content. So I really do want to thank the
13	Commission for pulling all of this together.
14	So I want to start in a somewhat prosaic
15	fashion since I'm, you know, the practicing lawyer
4.0	

- 16 here, not the academic, and to focus on the practice
- 17

1	to have, like, visual because this is something we
2	do all the time, but we don't necessarily think about
3	it. So the precise practice at issue and I'm not
4	making this up, like this is what the case is actually
5	about, okay so the restraint at issue in Ohio vs.
6	American Express was that when a merchant has decided
7	that they're willing to accept American Express cards,
8	and so they have a little decal on the door, and the
9	consumer goes into the store and then takes out their
10	American Express card, that the merchant at that point
11	is disabled, as a matter of contract, from encouraging
12	the consumer to use another form of payment.
13	Do we all have that in our heads? I can do a
14	replay, okay, just in case you missed it. So I'm in a
15	store, I have stuff I want to buy, I take out my
16	American Express card, and at that point, the merchant
17	is disabled from persuading me to use another form of
18	payment. That's what that case is about.
19	The precise legal issue that's teed up and
20	there are all kinds of things to talk about in the
21	opinions themselves. One and I think it would have
22	actually been nice, in sort of rereading the opinion,
23	had Justice Scalia been on the Court, because I would
24	have hoped that the case would have been slightly
25	clearer but the key legal issue is actually buried

4	in a factuate factuate 7 of the animian because the
1	in a footnote, footnote 7 of the opinion, because the
2	Department of Justice claimed that it could make out a
3	case challenging that restraint that we've discussed
4	and that I've described by pointing to the restraint,
5	plus the fact that American Express charged higher
6	prices for its services than its competitors, right?
7	So you have a restraint, plus higher prices, and
8	according to the Department of Justice, that's all they
9	need to show in order to shift the burden to the
10	defendant to justify the conduct.
11	The Supreme Court then holds, no, that's not
12	enough. If you're going to point to those prices as
13	direct evidence that the contractual provision that
14	you've identified has harmed competition, you actually
15	have to define the market and grapple with the conduct
16	in a coherent way to link the alleged restraint to the
17	higher prices, right? Otherwise, we just have this
18	sort of weird correlation, no real causation, and
19	that's not enough. That's the case.
20	So the claim that the case represents some
21	dramatic change in the trajectory of antitrust law
22	seems, on the facts, like the only word that comes to
23	mind well, I guess there are two. The polite way of
24	putting it would be hyperbolic. The less polite way
25	would be that's crazy, like and you can put whatever

1 expletive you want in front of crazy, right? Like I 2 have all kinds that I put in my head, and I'll just 3 omit them in polite conversation, but, like, that's 4 nuts. 5 And to demonstrate the nuttiness of it, let's 6 recall another super famous two-sided market case, also 7 involving the Department of Justice, also involving a 8 loss in the Supreme Court, and I don't mean 9 Times-Picayune, right? My famous two-sided market 10 case, for what it's worth, is U.S. vs. Chicago Board of 11 Trade. When I teach two-sided markets in antitrust 12 law, I always start with Chicago Board of Trade, right? 13 And let's then go back and think about Chicago 14 Board of Trade for a second. So the Department of 15 Justice case in Chicago Board of Trade consisted of a 16 set of rules that restricted how traders on the floor 17 could trade grain that was going to arrive at the end 18 of the closing session, and the joint venture adopted a 19 rule that said if the grain was arriving after 2:00, 20 you couldn't purchase it at a price other than the 21 price at the end of the closing session. That bothered 22 some traders and some railroad owners, I think, I think 23 that's the sort of subtext of that particular case, and 24 so then the Department of Justice sued. 25 Justice Brandeis said, like, that's not enough

**13** 10/17/2018

1	the other side on board; or another option is a large
2	intermediary that might be able to steer a group of
3	buyers or sellers to become sort of the anchor tenants
4	of your platform.
5	So an entrant can raise capital, sort of
6	subsidize an initial set of parties to participate, and
7	then pull the other side in, and this is very common,
8	and it's been, you know, used across all the
9	marketplaces that we know and love to get started.
10	Of course, incumbents recognize that as being
11	the key path to entry, and so they also realize, then,
12	if they can stop entrants from acquiring a big set of
13	consumers or sellers through business deals, then they
14	may be able to really impede entry.
15	Another thing that they can do is to avoid
16	letting the entrant kind of easily siphon off a

- 1 intentionally use some examples that are not happening, 2 so, please, nobody tweet that I said these specific 3 examples are happening, okay? 4 I'm going to use firm examples that I'm not 5 aware are doing this just to sort of get us thinking 6 about, you know, how we would interpret that conduct. 7 So these things have happened but just not by these 8 specific firms or in these industries. 9 So a first example would be suppose that Amazon 10 told booksellers that they were not allowed to use 11 software that helped them figure out whether the best 12 place to sell their particular book is on eBay or 13 Amazon, okay? So suppose Amazons said, if you want to 14 use that kind of software, you have to communicate with 15 us by uploading CSV files. You can't actually plug 16 into our software and change your prices in real time. 17 What would we think about that? We might think that 18 that might somehow be bad for competition between 19 Amazon and eBay. 20 Suppose that Amazon owned the software that 21 booksellers used to try to decide where to sell their 22 books, whether on Amazon or eBay or other platforms, 23 but they didn't actually give exactly accurate 24 information about where to sell, and, in fact, they
- 25 suggested that sellers sell on Amazon when they might

- 1 get a better price on eBay. That also might concern us
- 2 from a competition standpoint.
- 3 Another type of hypothetical example, suppose 4 there was a car review website that had blogs and 5 information about, you know, where to buy stuff on 6 cars, and Amazon said to that car review website, well, 7 if you want to put an affiliate link in the part where 8 you talk about books, so if you want to make money on 9 your car review website by linking to Amazon and 10 getting a commission for referring book customers, 11 well, you also have to use Amazon affiliate links on 12 the page that sells auto parts. So you can't actually 13 put an affiliate link for an auto part website over 14 there. Again, we might think that would make it hard 15 for an auto part e-commerce site to enter because they 16 would have a hard time acquiring customers if they 17 didn't also sell books, and so it would sort of make it 18 hard for them to acquire a big group of customers by 19 making a deal for affiliates from the popular blog 20 website. 21 And as a final hypothetical, suppose that AT&T, 22 having now entered the advertising business, decided to 23 charge higher prices to Amazon if they showed ads 24 through DirecTV, and Amazon couldn't advertise its
- 25 books or its Prime delivery for the same price as other

- 1 advertisers through DirecTV.
- 2 So I think all of these would at least cause us
- 3 to stop and question, you know, whether those types of
- 4 practices had efficiency benefits, as well as whether
- 5 they might cause some harm to competition, and you
- 6 might be really the most worried about long-term harm
- 7 for competition, those cases that might make it hard to
- 8 have real platform competition that really incentivised
- 9 the platforms to behave well.

10 So all of those examples were actually

- 11 motivated by work that I did when I spent a lot of time
- 12 working in another industry, which was internet search,
- and those types of practices were really common, and
- 14 sort of maybe perhaps surprisingly, they really were
- 15

1	engine on the iPhone. I read a recent news report I
2	don't know if it's true that that was 9 billion in a
3	recent year. So these types of business deals are
4	used, and they are used for, you know, being the
5	default engine on browsers, and they used to be used
6	for PCs and phones and various other types of
7	mechanisms for acquiring consumers. And, indeed, you
8	know, Google got its start through a series of these
9	deals.
10	Just as an example of how one of those worked,
11	when Bing first entered the search market well, it
12	wasn't called Bing then. When Microsoft did, Microsoft
13	and Google competed to be the default search engine on
14	AOL, and actually Google ended up paying more than 100
15	percent of the search revenue from advertising to AOL
16	in order to make sure that that ten points of market
17	share stayed with Google rather than went over to
18	Microsoft's search engine.
19	And so those types of business deals are
20	actually really important behind the scenes, and so
21	what types of conduct that you might worry about in
22	those cases are making the exclusive deals go across
23	countries, across all different types of searches,
24	across all different websites operated by the same
25	company, and those things might make it difficult for

1	new entrants to come and get a toehold.
2	So, broadly, I think that we want to think
3	about exclusive conduct in these types of markets,
4	especially in environments where it's really important
5	to be able to acquire, say, consumers in order to
6	really get a platform going and have later platform
7	competition.
8	MR. CONNER: Okay. With that, I'll turn it
9	over to Judy.
10	MS. CHEVALIER: Okay, thanks.
11	So I think I'm going to start maybe behind
12	where everybody else started and try to give what I
13	think is the kind of list of things we might actually
14	worry like, the categories of things we might worry
15	about as anticompetitive potential issues in platform
16	markets, and then talk a little bit about practices
17	that might create them, all right?
18	So what are we worried about? So, number one,
19	I think we're worried about when we say exclusionary
20	conduct, what kind of conduct are we worried about? So
21	I think number one is some situation in which we can
22	make a case that a multi-sided platform effectively
23	shuts down competition outside the platform, and that
24	would be either from a rival platform, which Susan
25	focused a little more on that, or from individual

- 1 platform members themselves, right? So participants on 2 the platform's outside competition. So that might be 3 one set of things we worry about. 4 The second set of things we might worry about 5 is a situation in which a vertically integrated 6 platform provider creates conditions that grossly favor 7 its own product over the other products on the 8 platform, okay? That would be a situation that we 9 might, again, in principle possibly worry about. 10 The third, I think -- and I think this is the 11 lens through which some people view the AmEx case -- is 12 a platform creates negative externalities for consumers 13 not using the platform. 14 And then the fourth, which is probably a little 15 aside from our topic today but I will add it for 16 completeness, is a situation in which the platform 17 functions to facilitate collusion among the platform 18 participants. So when I think of a complaint against a 19 multi-sided platform, I typically want to think about 20 which, if any, of those four buckets that I just 21 described is it implicating. 22 Now, I think one of the challenges in looking 23 at this -- and I agree with Dick's opening statement 24 that this is -- that all of these cases are just
- 25 fact-specific, which makes it hard to derive too many

- 1 the site and, therefore, you know, typically restrain
- 2 the extent to which the hotels offer cheaper prices on
- 3 their own sites, for example, or on rival sites than,
- 4 on the travel booking site.
- 5 Now, is there a good efficiency rationale for
- 6 that? Yes, right? A lot of people will search the
- 7 travel 12 0cn21 sehe trfacilion thprovide ,h.p151.08 576.54 prices (in94 122.34 531.48

1	on Amazon, you know, preventing them from offering
2	cheaper prices elsewhere, would there be a substantial
3	free-riding justification for that, given people are
4	using Amazon and the app to find out that there's a
5	cheaper price at some website they didn't even know
6	about? Yes. Is there also the argument that in some
7	dynamic sense that would have the effect of restricting
8	competition? Yes, I think it probably would, right?
9	So I think when we think about these cases, the
10	trick here and I don't think we've been very
11	disciplined about thinking of the rules is we need
12	to think about situations in which we have to ask
13	the question, how dominant does a firm have to be to
14	have this explanation override or the anticompetitive
15	concerns override an efficiency rationale?
16	Thanks.
17	MR. CONNER: Okay, thank you.
18	And last, but certainly not least, Pinar, and I
19	will turn the clicker over to you in the hopes that you
20	can operate it better than I can.
21	MS. AKMAN: Thank you. Thank you, and I'm
22	grateful to the FTC for the invitation. It's an honor
23	to be here.
24	So I would like to continue on the theme of
25	these MFNs, and like Dick, I also take the platform to

1 mean an intermediary that facilitates a transaction 2 between two parties, and this platform is usually 3 remunerated by a commission. So I'm not looking at 4 platforms that might be funded by advertising, for 5 example. 6 So in the European Union, in the last two to 7 three years, we have had at least 16 recent 8 investigations that have concerned platform MFNs. 9 There are 28 member states for the moment, until the 10 end of March, so quite a few of the European Union's 11 national competition authorities have looked at these 12 MFNs in different contexts. Most of them have 13 concerned online travel agents, but we've also had the 14 Competition Commission, now the CMA in the UK, look at 15 price comparison websites for insurance, and there's an 16 ongoing case against one of these price comparison 17 websites. There's also been a case against an online 18 auction platform in the UK again. 19 At the E.U. level, the European Commission 20 itself looked at Amazon's MFNs. Interestingly, these 21 were MFNs in Amazon's contracts with e-book publishers, 22 like the case in Apple, which preceded this, and Amazon 23 had required e-book publishers to agree to these MFNs 24 so that Amazon will not be beaten on price, but part of

those clauses also required these book publishers to

inform Amazon of any better clauses elsewhere.
·
The Bundeskartellamt, the German federal cartel
office, also looked at Amazon and actually in a
scenario quite close to what Judith described, so the
Bundeskartellamt cartel office found that Amazon had
MFNs with all the sellers who were selling everything,
basically, so it wasn't specific to books, but Amazon
had these MFN clauses in the contracts with third-party
sellers by which they were promising to Amazon that
they will not essentially sell the same product
elsewhere more cheaply. Amazon terminated its practice
to end the proceedings.
Now, in the E.U., after all these cases, a
distinction has been made in relation to these MFNs.
So this distinction is between so-called wide MFNs and
narrow MFNs. By wide MFNs, the authorities refer to
clauses that align prices across all sales channels, so
the price on platform A will be the same as on all
platforms, as well as the seller's own website, as well
as the seller's offline sales channels.
And by narrow MFNs, they refer to clauses
seeking parity between the platform and the supplier's
online sales only. And this distinction has proved to
be quite fundamental because the enforcement practice
has really been based on this distinction.

**26** 10/17/2018

<ul> <li>Similarly, this can foreclose other platforms.</li> <li>So a new entrant who would like to enter the platform</li> <li>market will not be able to cut prices to steal</li> <li>customers from the incumbent platform because the MFN</li> <li>will, again, match the price for the incumbent as well.</li> <li>Because they were sort of more similar to</li> <li>price-matching guarantees, commenters have suggested</li> <li>that these should essentially be treated in the same</li> <li>way as resale price maintenance clauses, but then more</li> <li>recently we see again in the economics literature that</li> <li>there are models which show that actually all types of</li> <li>MFN clauses, including wide MFNs and narrow MFNs, may</li> <li>increase welfare, and they may increase welfare of</li> <li>consumers as well as the surplus of the platforms and</li> </ul>

<ul> <li>increase welfare, and they may increase welfare of</li> <li>consumers as well as the surplus of the platforms and</li> </ul>	
15 consumers as well as the surplus of the platforms and	
16 the suppliers	
17 In that model, what's crucial is that the	
18 seller in such a scenario has its own direct sales	
19 channel as well, but I won't go into the details of	
20 that. So the economics of it hasn't really been	
21 settled in any way.	
22 In terms of what about multi-sided markets make	
23 sort of the assessment different, I think several	
24 features of these markets make the assessment of these	
clauses more complicated. The most important one in my	

- 1 view is the fact that these platforms operate on the
- 2 basis of an agency model.
- 3 So in my research, I would argue that these
- 4 platforms are legally agents of the suppliers, so from
- 5 an antitrust point of view, these clauses really fall
- 6 within the single economic entity doctrine, and that
- 7 should essentially take these clauses out of the scope
- 8 of a Sherman Act Section 1 or Article 101 TFE treatment
- 9 in the E.U.
- 10 Why are they agents? Because they never own
- 11 the product. They never set the price for the product.
- 12 They don't assume any of the financial risk arising out
- 13 of the contract between the platform and the third
- 14 parties, which is the crucial factor at least in the
- 15 E.U. when we look at agency, so -- and I think that
- 16 should say something to antitrust enforcers about what
- 17 sort of theory of harm might be the relevant one here,
- 18 because these are essentially contracts between a
- 19 seller and agent of the seller.
- And the agency model also further complicatesthe theory of harm because we've seen in the cases in
- 22 Europe, it's not always entirely clear whether the
- 23 restriction we are concerned about here is, for
- 24 example, the restriction of interbrand competition or
- 25 whether it's about the restriction of intrabrand

1	competition.
2	So the competition between different retailers
3	or well, agents in this case selling the product of
4	the same company, and if we look at the Apple case,
5	e-books case in the U.S., for example, we see that the
6	theory of harm there was clearly a horizontal
7	price-fixing conspiracy type theory of harm, whereas in
8	the online travel agent cases in Europe, the clauses
9	are very similar. The theory of harm seemed more like
10	a vertical restraint type theory of harm, rather than a
11	horizontal conspiracy, but there were sort of the
12	the decisions sometimes alluded to an effect on the
13	horizontal competition between platforms as well.
14	So in terms of other specific features of these
15	markets, efficiency arguments, as Judith mentioned, are
16	something to really look into here, and these platforms
17	operate on the basis of commission normally, and if
18	consumers always use the platforms to search and find
19	what they like and go to the supplier's own website to
20	then enter into the transaction, the platform never
21	essentially makes money out of its business.
22	And also, consumers over time learn that
23	actually this platform is not really a good way of, you
24	know, finding out about anything, because I can always
25	find the same product at a cheaper price on the

1	supplier's own sales channel. So this argument was
2	called the credibility argument in the UK Competition
3	Commission investigation into the insurance comparison
4	market, and the Competition Commission actually
5	accepted this as a valid efficiency argument, arguing
6	essentially or accepting that the platform business
7	model will eventually collapse if their own channel can
8	always undercut the platform on the price. There's
9	also another efficiency argument which has to do with
10	low-quality, low-cost platforms free-riding on the
11	services of the high-quality, high-cost platforms.
12	So just to conclude in terms of what antitrust
13	enforcers should be looking for in these markets, I
14	think as, again, Judy mentioned, market power is quite
15	important. Again, in my research, I argue that the
16	European cases would have been a lot better dealt with
17	as potentially abuse of dominance cases rather than
18	agreement cases. In those cases, the clauses were all
19	adopted in markets with four to five platforms,
20	maximum, so they are quite tight oligopoly markets,
21	some of these markets. And another key factor to

- 1 the case law as well as the sort of developing
- 2 economics literature on this, the form of the clause,
- 3 so whether it's a narrow platform parity clause or a
- 4 wide parity clause doesn't seem to matter, and it
- 5 really should be about trying to figure out the effects
- 6 of the clauses on a clearly identified theory of harm
- 7 in relation to interbrand competition or intrabrand
- 8 competition or both.
- 9 Thank you.
- 10 MR. CONNER: Thank you.
- 11 So before turning to individual questions, I
- 12 wanted to give the panel the opportunity to respond to
- 13 any of the comments that have come out from the other
- 14 panelists. So, Susan and then Tom.
- 15 MS. ATHEY: Yeah. Just to sort of pick up on
- 16 some of those comments, I think I appreciated all the
- 17 comments from Judy and Pinar about the price comparison
- 18 engines, but I think one efficiency part that maybe
- 19 wasn't fully explored is just the impact of the way a
- 20 price comparison engine works on competition in the
- 21 industry.
- 22 So some research by Glenn Ellison focused on
- this, as well as some empirical analysis of what
- 24 happened on eBay when they made price comparison more
- 25 transparent. Generally, if a price comparison engine

1 sort of works better and makes it very clear what the 2 prices are, that really toughens competition among the 3 sellers and can make the sellers lower their prices and 4 lower their margins. 5 And so, say, like, if eBay forces the sellers 6 to show their shipping costs and makes it sort of more 7 transparent, how to actually compare offers across 8 firms, that really makes the products much more 9 substitutable, reduces search costs, lowers prices, and 10 increases welfare to consumers, and so the -- you know, 11 when -- I know Glenn Ellison called it obfuscation, but 12 generally in the context of a price comparison engine, 13 the participants are going to want to try to find ways 14 to make it harder to search and soften the price 15 competition, because people using a price comparison 16 engine often end up being much more price-sensitive 17 because it's so easy to make those comparisons. 18 And so I think an efficiency benefit of sort of 19 forcing the sellers to have full transparency is that it reduces search costs, and I think, you know, those 20 21 benefits can vary by industry. So if there's only 22 three sellers you're comparing among, maybe it's not so 23 hard for the consumer to go to their individual 24 websites and do the comparisons, but if there's lots of

25 different sellers and they're, you know, very

1	differentiated, and there might be an infrequent
2	purchase, something like that, then the consumer
3	welfare harm of not being able to easily shop and
4	compare could be quite large and could really have a
5	big effect on price competition.
6	MR. CONNER: Tom, and then Dick.
7	MR. BROWN: So I think as the only
8	card-carrying lawyer on the panel, I want to and I
9	love economists, many of my best friends are
10	economists but I want to pull back a little bit and
11	make a legal point, and it's prompted by an observation
12	that Judy made that, I think, comes through some of the
13	other content associated with these I think we call
14	them hearings, right? Yes, hearings and that's a
15	question about why and what we think the antitrust laws
16	are designed to do.
17	I think there are sort of two themes that are
18	coming through well, a lot of the discussions, some
19	I think more from economists and some I think more from
20	lawyers. So I think this is a hypothesis I think
21	economists, when they think about antitrust law, think
22	of antitrust law as a tool for optimizing market
23	outcomes. I think lawyers and that's, like, maybe
24	natural given the econ pedagogy. I think lawyers, when
25	

- 1 tool for protecting roughly the process of competition
- 2 from conduct that borders on industrial sabotage.
- 3

For The Record, Inc. (301) 870-8025 - www.ftrinc.net - (800) 921-5555

context, the argument is you accept the American
Express card. That raises your costs. You spread
those costs over all your customers, even those who
don't carry and don't use the card, and that issue has
or that process and whether it's good or bad has been
debated in a number of settings, in a number of
contexts.
We regulate debit card fees in this country,
for instance. We don't regulate credit card fees.
It's hard for me to see that as an antitrust concern.
It's a legitimate subject for debate. It's a
legitimate subject for concern. But if you take Tom's
point of view that the antitrust laws are about
competition, I don't think it falls there.
I think there may be some reason why you look
askance at credit cards, at payment cards, as a lot of
people do, but I don't think it's an antitrust offense.
That's how that market works. You don't like it, there
are ways to fix it, but bringing a monopolization suit
doesn't strike me as the way to do it.
Just a quick comment on Susan's point about
price comparisons. I'm reminded of the many
business-to-business exchanges that were set up in the

- 24 dot-com boom and all the press that said these are
- 25 going to make price comparisons easy. It's going to

- 1 make shopping for businesses looking to acquire nuts,
- 2 bolts, whatever, much easier and much more transparent.
- 3 They almost all failed, and all that transparency and
- 4 reduction in transaction costs didn't occur because
- 5 sellers didn't like price transparency, thank you very
- 6 much, and they didn't sign up. So thinking about
- 7 what's good and what's bad in these complex markets is
- 8 not altogether straightforward.
- 9 And one other comment, Susan listed a whole
- 10 bunch of practices, and I would only saym -.00 BmwTj 11.94 0 0 11.94 115.2 4641.20 1

less well, have less incentive to go out and create more content. So it's an environment, and when you go to think about predation, you sort of think about a
more content. So it's an environment, and when you go to think about predation, you sort of think about a
So it's an environment, and when you go to think about predation, you sort of think about a
think about predation, you sort of think about a
abort tarm part of apprifica for a long tarm gain
short-term sort of sacrifice for a long-term gain.
It's particularly tempting to do that in a market where
you know that if you sort of temporarily, you know,
steer away consumers from this downstream firm, that
they will be permanently sort of damaged. Their
quality will be lower, which makes them a less
effective competitor in the future, and especially if
they are sort of startups, they may, you know, run out
of money.
So, you know, I worried about, say, making,
say, a temporary sacrifice by, say, looking up a less
good shopping engine on the page, which is sort of
hurting your let's say a search engine's user
experience in the short run as a way to, you know,
advantage their own shopping site against a competing
site, which then ultimately, if that competing site

just gets sort of depressed, it's not as good, then in
the long run, it's actually not a sacrifice anymore,
because now the competing site is not as good quality.
So the consumers don't mind if it's at the

- 5 bottom of the page because it actually isn't any good
- 6 anymore, and you don't actually suffer any kind of
- 7 long-term harm from that manipulation. So I worried
- 8 about that from an efficiency perspective, because it,
- 9 first of all, could -- if you think that these
- 10 businesses are very innovative, then, you know, there's
- 11 no reason to think that a monopoly firm is going to
- 12

1

2

3

4

1	that costly to really damage downstream competitors.
2	MR. CONNER: Thank you.
3	And, Dick, a related question. Is there
4	nonprice conduct that may seem exclusionary if you look
5	at only one side, but may be efficiency-enhancing if
6	you look at the whole platform?
7	MR. SCHMALENSEE: Well, as a logical matter,
8	there almost certainly are such examples. I wish I had
9	some good snappy ones, but I spent some years on the
10	board of a securities exchange, an options exchange,
11	and options exchanges are platforms that bring
12	together particularly that one as it was set up
13	bring together liquidity providers and liquidity
14	takers, and we spent every board meeting discussing
15	rules, typically nonprice rules, that limited what
16	liquidity providers could do, how brokers could behave.
17	Were some of those exclusionary? Probably if
18	you looked at them through the wrong lens, they might
19	be. Our objective obviously was to make our enterprise
20	more attractive to both sides, and so occasionally you
21	had to restrict behavior and even membership on the one
22	side in order to make sure the other side found the
23	market attractive.
24	And you can imagine nonprice restrictions on,
25	say, Uber drivers that might limit participation of one

1	kind or another. I know a retired fellow who drives
2	for Uber, and he loves to drive his friends, so he
3	lurks in his neighborhood and waits until somebody
4	wants a right and, bingo, he's there.
5	Now, if I'm Uber, I might not like to have that
6	behavior. I might like to exclude him, because it is
7	kind of strange, but, you know, I might want to do that
8	just because I'd like my drivers to actually go to
9	where the demand is rather than lurk. I would exclude
10	him. Is that a bad thing? Probably not.
11	So I think the general principle from Susan's
12	examples and my nonexamples is that you really want
13	to in a two-sided context, you really want to look
14	at the implications of rules of any kind on both sides
15	and for the enterprise as a whole, because rules may
16	look exclusionary on one side but be for the benefit of
17	the enterprise as a whole, or they may be profit-
18	sacrificing but output-enhancing if you look at the
19	whole thing. So I mean, it really is important to look
20	at both sides.
21	MR. BROWN: So I think I may have an example,
22	and this was not planned, but, like, this card is kind
23	of, like, an example. So this is a collector's item.
24	It's a Bank of America-issued American Express card.
25	MR. SCHMALENSEE: Wow.

- 1 MR. BROWN: Yes. And the reason this card
- 2 exists is because of a prior Department of Justice
- 3

For The Record, Inc. (301) 870-8025 - www.ftrinc.net - (800) 921-5555

1 evaluating the constraint, you needed to look at both 2 sides. 3 The rule went away. Banks began issuing 4 American Express cards and, not surprisingly and 5 consistent with the claims that both the card networks 6 had made in the litigation, you saw more price 7 competition at the portfolio level, and merchant 8 discount rates and interchange went up. 9 MS. ATHEY: So just to maybe give another example that might be -- you could imagine somebody 10 11 having different opinions about would be something like 12 thermostats. So you might have thermostat companies 13 make thermostats and charging a price greater than 14 marginal cost. You could imagine a firm coming in and 15 deciding their business model is actually to acquire 16 consumers for an Internet of Things platform and view 17 the thermostat as a customer acquisition device and, 18 you know, subsidize the cost of the thermostat in order 19 to induce the consumer to start using apps or a 20 platform more broadly, or they might have a broader 21 value for the data. They might think more consumers 22 and then they'll get more apps and monetize later. 23 And it is pretty common, I think, for platforms 24 to think about, say, a device as a consumer acquisition 25 device from -- a consumer acquisition vehicle in order

to monetize then later, and so that would be very sad
for you if you were a stand-alone thermostat company,
but in general, these changing business models you
know, the industry might evolve so that, you know,
vertical integration or becomes important or at
least thermostat companies need to somehow receive some
subsidy from a platform in order to be competitive,
given that the consumer is now getting brought onto a
platform, and that's part of the benefit of having the
consumer adopt the good.
I also want to pick up on something that Dick
said that I think is super important. When platforms
often have to make a fair number of rules in order to
make the platforms function efficiently, and sometimes
those rules trade off the different sides of the market
but in a way that is output-enhancing. So just some
examples, like, you would eBay could reward sellers
and rank them more highly if they have high star
ratings and they ship faster, and that's a really
important thing for eBay to be able to do.
And, you know, a seller in Alaska might feel,
you know, discriminated against because they can't ship
as fast as other sellers, and that might be sad for the
seller in Alaska, but it's important for the platform
as a whole to be able to provide fast shipping;

- 1 otherwise, consumers will leave the platform and go
- 2 elsewhere.
- 3 And so a bunch of things, you know, making sure
- 4 that Uber drivers drive safely, that they keep their
- 5 cars clean, that they don't turn down too many rides
- 6 that are suggested to them; you know, making sure that
- 7 Airbnb hosts keep their calendars up to date and don't
- 8 reject bookings; all of these things are very
- 9 important.
- 10 I just had -- I tried to book a ski condo this
- 11 weekend, and then the seller cancelled on me after I
- 12 had already booked my flights, and I was really
- 13 disappointed. I want the platform, you know, to demote
- 14 that seller because that was a bad experience. It
- 15 makes me want to just go book a hotel where they are
- 16 not going to cancel on me.
- 17 So, you know, there are -- and there's a whole
- 18 host of practices, and I think as the platforms mature,
- and especially if they're more competitive on the
- 20 consumer side, they do tend to squeeze the sellers,
- and, you know, Amazon squeezes its sellers, and, you
- 22 know, historically Walmart squeezed its sellers, and
- that is tough for the sellers.
- 24 But at some level, like, economic efficiency
- 25 wants the sellers to be, you know, forced to be pretty

1 competitive, to provide high quality, low costs, low 2 margin. That's what expands output. And at some level 3 the platform is acting on behalf of the consumer to 4 force them to provide that, and you don't want to get 5 in the way of them. 6 MR. CONNER: So before turning to the next 7 question, I did want to let everyone know in the 8 audience that FTC staff is walking around with question 9 cards. So if you do have a question, just hale them and you will be able to put in a question. 10 11 So the next question I have is for Judy, and 12 this actually plays off of something that Susan was 13 just talking about. The FTC, in these hearings, has 14 received a number of comments arguing that the success 15 of Amazon's Prime Program, where you pay a flat fee for 16 access, is a tool that Amazon uses to exclude 17 competitors. For instance, Stacey Mitchell from the 18 Institute for Local Self-Reliance writes, "There's 19 evidence that being a Prime member alters consumer 20 behavior. When people pay for Prime, they naturally 21 want to maximize the value in free shipping and they 22 derive it by doing more shopping on Amazon. Studies

23

Program to a two-part tariff, a pricing scheme that is
ubiquitous in many markets, including retail
markets for instance, in Costco and does the
multi-sided nature of the Amazon business make the
pricing scheme more questionable?
MS. CHEVALIER: Yeah. So I think the answer to
that is it is a two-part tariff, and it's hard to see
really how the multi-product part really I mean, the
platform part affects that. I mean, I think you
know, one thing that's been floating a little bit in
some of the conduct that we've been discussing and
Pinar had this discussion of platform MFNs versus
regular MFNs and one characteristic of the platform
MFNs is that the kind of language the contractual
language is a contract referencing rivals, right, which
is language people sometimes use to think about a
category of contracts that we might want to give extra
scrutiny to.
I mean, Prime is not that. I mean, I

- 20 understand that you have to have a certain amount of --
- 21 you know, Amazon had to have a certain amount of scale
- 22 to make Prime attractive, and I also understand that it
- 23 lowers the marginal cost for the consumer to purchase
- 24 Amazon products, but I think unless you're going to
- 25 entirely abandon a consumer welfare standard of

1	antitrust law, it's hard to see it's hard for me to
2	see why Amazon Prime would be a practice that anyone
3	would want to challenge.
4	MR. CONNER: So, Dick I'm sorry, let me ask
5	Dick and then Pinar.
6	MR. SCHMALENSEE: I'm in violent agreement with
7	Judy. It is true that unless you have scale as an
8	online platform or an online retailer, you really can't
9	profitably do this, but as an avid viewer of Amazon
10	Prime streaming and an avid shopper on Amazon, I am not
11	made worse off. It is tough for competitors because it
12	seems to be a very effective business strategy for
13	Amazon that does require scale. Costco does it. Other
14	people do it. Of course, when you become a Prime
15	member, you shop more on Amazon. That is the point.
16	It works.
17	I don't see how you would challenge it. Even
18	under an abuse of dominance standard, I don't know how
19	giving you a two-part tariff is an abuse of dominance,

20

For The Record Inc

**50** 10/17/2018

- 1 essentially all of the surplus goes to Google. So if
- 2 you're sort of a -- like a vertical price comparison or
- 3 shopping type of site, whether it's, you know,
- 4 e-commerce, like Amazon, but it applies to other
- 5 scenarios as well, as soon as the consumer thinks they
- 6 need to go back to Google and look at what the other
- 7 options are, you've lost all the profit from that
- 8 customer, because there's somebody else bidding against
- 9 you on Google who has a similar business model and
- 10 roughly, like, you bid up to the value of the consumer
- 11 and you pay it all back to Google.
- 12 So that's -- it's sort of a huge threat and
- 13 offeceyoudmobsol.944 taieboelyn.044 rDiroc 20 devibel ser filmos taompau 1111.94 115.2 193.08 Tr
- 14 itea by crowalky ensure that the yacomproviding a greated bar 4 0 day
- 15 for actually statisey that/the greats the both some both and the states of the stat
- 16 back and price-compare. So I think as long as there
- 17 are, you know, competitors out there who can plausibly
- 18 offer, you know, similar products at similar prices,
- 19 it's actually pretty -- you know, if I was advising
- 20 them from a business strategy perspective, I would tell
- 21 Amazon, like, I don't care if you've got Prime, and I
- 2216

1 go back to compare across sites, that's actually going 2 to be a really bad consumer habit to create. 3 So I think, of course, if all the other 4 retailers went out of business, you know, then you 5 would have a very different concern, but it -- at the 6 stage where they're moderate in size and there are 7 other e-commerce firms out there, in the medium run, 8 they want to keep prices low, even though I'm sure if 9 you did a study, Amazon could raise prices on a ton of 10 products in the short run and not lose customers, 11 because we all love our Prime so much. 12 MR. CONNER: Okay. So I want to turn now to 13 MFNs, and, Pinar, you talked guite a bit in your 14 presentation about this. Jean Tirole speaking about 15 MFNs in the travel industry said that a requirement 16 that hotels use a particular platform allows users to 17 book rooms and -- excuse me, allows users to book rooms 18 that may not offer lower prices on other platforms, and 19 she has said that a higher market share is not 20 necessarily a condition for competitive harm. 21 Do you think that this is correct? And if so, 22 how would the antitrust doctrine treat those MFNs 23 differently than from other restraints? 24 MS. AKMAN: Thank you. It would be extremely 25 foolish of me to disagree on a point of economics with

1	a Nobel Prize laureate in economics; however, other
2	economists have, and Jean Tirole himself did say in the
3	same interview that the economists haven't yet done
4	their homework on this.
5	This is actually really interesting, because
6	this point ties in really well with the discussion we
7	were having earlier, started off by Susan's comments
8	and then Dick's comments on Susan's comments, so the
9	question of whether these platforms are actually
10	bringing added value, so there are socially valuable
11	services, or are they essentially a negative
12	externality on the consumers who don't use the
13	platforms, because I think it's exactly in that context
14	that Jean Tirole made the comment.
15	In his book as well, he basically suggests
16	these platforms shouldn't turn into parasites, because
17	he thinks of them, at least, as a private tax levied on
18	the platforms levied by the platforms on the
19	consumers who don't use the platform. So as Judy
20	mentioned in her remarks, he refers to that point about
21	them imposing a negative externality on consumers, but
22	then essentially putting that together with Susan's
23	comment later that these platforms reduce search costs
24	and make it so much easier for consumers to, you know,

25 find what they want to buy or what they want to book, I

1	think there's a question about whether these platforms
2	
	bring socially valuable benefits and essentially
3	whether the commission that the hotel is paying to
4	Booking.com is worth that added value the platforms
5	bring as a socially valuable benefit.
6	In terms of market power, I think there has to
7	be some level of market power, because if this platform
8	has no market power at all and it's not a gateway to,
9	let's say, a unique group of consumers, then I don't
10	see why the supplier, be it a hotel or a book
11	publisher, wouldn't just walk away from that platform
12	and go sell elsewhere. So that level of market power
13	certainly does not need to be at the level of market
14	dominance, but I think there has to be still some level
15	of market power which would provide essentially the
16	platform with a bargaining chip to go to the suppliers
17	to say I have these unique consumers again, this is
18	similar to what Jean Tirole was mentioning and if
19	you want to sell to these consumers, you will have to
20	join my platform, and you will have to pay my 30
21	percent commission fee.
22	So in short, I think market power is relevant
23	but not necessarily at a level of dominance.
24	MR. CONNER: Tom?
25	MR. BROWN: So I just wish I had a little bell

1	like Clarence in It's a Wonderful Life that I could
2	ding whenever we fell into this gap between are we
3	trying to optimize market outcomes or are we trying to
4	protect the process of competition, because like this
5	conversation falls squarely in that gap.
6	MR. CONNER: So I will say I'm not sure what
7	price angels would get every time you dinged on
8	vertical restraints, but
9	MS. CHEVALIER: Let me, if I could just add to
10	that, I do think that this is an area which requires a
11	little more work, and I you know, we talked about it
12	in the context of the travel MFNs. An antitrust case
13	which two antitrust cases that were settled which I
14	

1	empirically and theoretically, and I do think that it
2	has something to do with this question of a platform
3	that is is there or are there separate
4	considerations somehow for a platform that offers a
5	gateway to a unique set of consumers? And how do we
6	have to think about the fact that they have made real
7	investments in servicing and serving that particular
8	set of consumers?
9	So, again, I think I would give the
10	antitrust I would allow the antitrust laws to do a
11	little more than just stop industrialists from blowing
12	up each other's factory, but I understand this is
13	actually but I agree with Tom, this is actually in
14	the area of, you know, how much you know, how
15	exactly would we make a kind of disciplined set of
16	rules around that that make sense.
17	MR. SCHMALENSEE: Just a quick reaction on
18	another point that would go in the same direction.
19	Imagine a booking site that has a relatively small
20	share of bookings, but that signs platform MFNs or most
21	favored customer clauses or contracts with a wide range
22	of suppliers. So if you just looked at booking share,
23	it's small, but if you have those contracts with a wide
24	number of a large number of suppliers, you have
25	affected the whole market, even though you, yourself,

**57** 10/17/2018

1	them that are not improving their price or decreasing
2	quality, strategies like, you know, steering consumers
3	away from current competitors or potential competitors
4	or other things, I mean, sabotaging your opponent's
5	factory is one, but there's actually the modern
6	business world actually has a lot of different kinds of
7	practices that aren't efficiency-enhancing, and, in
8	fact, when faced with competition, you can you could
9	be going along behaving very nicely, and then when
10	confronted with a perceived competitive threat, you
11	could start using some strategies that are very
12	welfare bad for consumer welfare.
13	So I think understanding the business and
14	economic contexts, the strategy space, the incentives,
15	the way that incumbents and entrants think about
16	problems, is pretty crucial, and if you start trying to
17	put it into the legal framework too quickly, you'll
18	start getting caught up with market definition and, you
19	know, oh, gosh, we don't do predation cases because
20	they always lose, and, you know, that kind of sounds
21	like predation, and so you can kind of like, you know,
22	just shut down the conversation before you've really
23	understood the economic tradeoffs.
24	And then, of course, we have to decide whether
25	achieving economic outcomes that are beneficial is

- 1 possible in a clear, simple legal framework that
- 2 doesn't cause more harm than good, but I think first
- 3 having a pretty clear view of the economic outcomes,
- 4 especially for having a debate about what policy should
- 5 be or what the law should be, is kind of the right
- 6 place to start. We can decide that it's too
- 7 complicated to get to the optimal outcome, but we need
- 8

restraints, we're really talking about unilateral
conduct in another garb, so I think the distinction is
actually robust. Good question, though.
But I and, I mean, I agree with Susan about
sort of thinking and deeply investigating the nature of
business conduct. I think what the the reason for
sort of prompting and recognizing the gap, right in
the sort of, you know, "London Tube mind the gap" sense
is that the conversation we're having over the last
couple of days about platforms and about the
significance of Ohio vs. American Express and whether
Ohio vs. American Express represents some significant
departure from the way we've understood antitrust law
for almost a hundred years, like 99 years to be exact,
and I don't think so.
I mean, that the that case is about a
legal tactic that had been adopted by the Department of
Justice over the last 20 years, which was to say that
we don't have to define the broader context in which
we've identified some behavior that we think may lead
to anticompetitive effects. Once we identify something
we don't like and we can point to higher prices on one
side of a jointly consumed product, the burden shifts
to the defendant to say that there's no restraint.
I thought that was grossly unfair and

- 1 inconsistent with U.S. antitrust law when I was a baby
- 2 associate defending Visa on a case that was so stated.
- 3 I thought it was grossly unfair, though highly
- 4 ironic -- and in that sense enjoyable -- when the case
- 5 was brought against American Express, but the -- like,
- 6

1 effects in vertical restraints by multi-sided 2 platforms? 3 MR. BROWN: Hmm. So I'll take the first stab 4 at this question, but I actually -- sort of recognizing 5 the limits of my economic intuition -- I think it's in 6 some ways a question that as a lawyer I would first go 7 to an economist to get an answer to. 8 MR. CONNER: And to be clear, I am going to 9 follow up with Judy, so don't worry. 10 MR. BROWN: Again, I think that antitrust 11 struggles to make -- antitrust, as a law, right, as 12 opposed to thinking about the role that competition 13 should play in public policy generally, which is sort 14 of a way of more broadly framing the debate, I think 15 antitrust really struggles to identify empirically 16 observable facts that support a prior hypothesis that 17 something is bad. 18 I think it's certainly possible to look at 19 increased output in a particular industry and to come 20 away from the conclusion that that should at least give 21 us some pause as to whether the underlying conduct is 22 anticompetitive, but the reason that platforms are 23 interesting, right, is that they demonstrate increasing 24 returns to scale. So from an overall consumer welfare 25 perspective, from a social welfare perspective, it's

1	not obvious that more output equals more benefit for
2	society or consumers as a whole. Like, so I think it's
3	kind of an uncertain signal.
4	MS. CHEVALIER: Yeah. So I think, you know, in
5	a simple antitrust framework, I think looking at
6	whether the conduct is output-increasing or
7	output-decreasing is a pretty good way to go. I do
8	think I do think there's a bunch of issues that make
9	it tricky. First of all, you mean output-increasing
10	relative to the appropriate counterfactual but-for, and
11	I haven't studied the AmEx case well enough to know
12	whether the appropriate counterfactual but-for is
13	actually what was being considered, but I do think
14	there are a set of complications, especially you
15	know, the credit card cases the credit card cases
16	and I have no dog in that fight, because I have never
17	worked on a credit card case. I don't really have I
18	have not studied them at great extent, but given that
19	one of the arguments in the credit card cases is
20	something about an externality, when there's something
21	about an externality, then you do actually want to be
22	careful about making an output argument as the kind of
23	basis of deciding whether something is anticompetitive
24	or not.
25	I think we almost always are going to come

25 I think we almost always are going to come --

**64** 10/17/2018

1 had constrained bundling in such a way that the bundles 2 were unattractive. 3 When the operators were free to optimize 4 product, they offered more attractive offerings. 5 People paid more for them. People were happier. There 6 were more subscribers. So just looking at "Q" doesn't 7 necessarily tell you anything of interest. 8 MR. CONNER: Susan, and then Tom. 9 MS. ATHEY: Just, I mean, maybe to reiterate an 10 earlier point about marketplaces, so if you think about 11 a simple example of a marketplace, imagine it's, you 12 know, the first entrant, and so it's running its own 13 marketplace. It's not that worried about competition 14 as essentially a monopoly marketplace. Even if you're 15 giving business strategy advice to a monopoly 16 marketplace, you -- the first way to think about it is 17 that a marketplace is a matchmaker, and it's trying to 18 expand output. 19 And so to a first approximation, when I teach 20 my students, I say, actually, marketplaces are kind of 21 fun businesses to be in, because you're mostly just 22 trying to make everybody better off. Like, you're 23 trying to make a -- make transactions smooth, and to 24 the extent that you're -- where you're charging, what 25 you should try to do is charge in a way that minimizes

**66** 10/17/2018

1

1	Not to say that platforms don't exert market
2	power over their participants in some cases, not that
3	everything that they do is in the social interest, but
4	a lot of the nonprice you know, if there's a price
5	you're charging, of course, that's a little bit zero
6	sum. If you're charging a fee for using the platform,
7	that's a bit zero sum between the platform and the
8	sellers, and they certainly might charge higher fees
9	than social welfare would suggest, but a lot of the
10	nonprice terms are often about making the platform more
11	effective as a whole. Not always, but that extent
12	looking at the output standard could be a good way to
13	think about it.
14	I just want to agree with Judy, though, that if
15	your main issue is externalities, you certainly, in the
16	credit card case I mean, I have not also worked on
17	these cases but, you know, if I think my main
18	problem is that cash-paying that this whole system
19	is regressive and that cash-paying consumers pay higher
20	prices, and there's this big cross-subsidization going
21	on, then you should presumably include those consumers
22	in welfare calculations, if you think that's the main
23	economic harm.
24	MR. BROWN: So I am going to actually give a
25	disclaimer on the credit card cases, too. I don't work

1	on them. I have not worked on them in years. I have
2	no reason to believe that I will ever work on them
3	again, notwithstanding the fact that I was once
4	in-house at Visa and think that not everybody there
5	hates me, but, you know, apparently too much exposure
6	produces some sort of antibody reaction.
7	The I do want to talk a little bit about the
8	particular context, though, of the U.S. vs. AmEx case,
9	because I think it's interesting, and it sets up a
10	point about natural experiments that I think is
11	important to think about from an antitrust policy
12	perspective. So just bear with me for a second.
13	So when the Department of Justice first brought
14	that case, they also challenged rules that Visa and
15	Mastercard had that were similar to, though not
16	necessarily congruent with, the AmEx steering rule. So
17	the industry conduct and there was no claim that the
18	rules had been adopted on a concerted basis, that they
19	had just emerged in parallel. So you have the three
20	then major card networks, each of which has some rule
21	that says that you can't discourage people at the time
22	that they've expressed an interest to use some other
23	form of payment.
24	Visa and Mastercard, in response to that
25	complaint, repealed their rules, and the sort of

missing person here, in case you're sort of wondering,
like, who cares about any of this stuff, it's let's
just identify it it's Discover. So Discover is sort
of and DOJ's sort of by adoption theory of
competitive harm was that somehow these rules prevented
Discover from being more than you know, let's just
be honest about this a rounding error in the
payments world, which if you just sort of step back and
think that that's a little implausible, like there are
other things going on that explain, like, why you're
fourth of three.
But what that I know, that's it's mean,
but it you're laughing because it's a little true,
too, like that's but so what that then set up was an
opportunity for a natural experiment, right, because
you had an industry where Visa and Mastercard had had
rules, repealed them, and so for merchants that only
accepted Visa, Mastercard, and Discover, and not
American Express, did you see behavior different than
the behavior that you saw in the AmEx-accepting
merchants.
And for me, like, that's the dog that doesn't
bark in the case, and, again, I think consistent with
why it seems sort of goofy to begin with, like, DOJ
does not attempt to introduce facts into the record to

## 1 establish that the conduct that they believed had been

2

1 Mastercards, but they actually don't want to take the 2 super high rewards cards, and so they actually want to 3 be able to discriminate across Visa and Mastercards. 4 which, you know, might actually -- you know, so we may 5 not be done with seeing the dog barking that you're 6 describing. 7 MS. ATHEY: Yeah. I actually wanted to bring 8 up another case that hasn't come yet, at least in the 9 U.S., but may end up not ever being an antitrust issue, 10 but it involves also credit cards, but the credit cards 11 are now on the other side of this argument and actually 12 would like to get rid of anti-steering provisions in a 13 different case. 14 So this is a case of ApplePay. So those of you 15 who have tested out ApplePay or seen it starting to get 16 more accepted, you see that you could put a credit card 17 into your Appeal Wallet and then use that to make 18 transactions. What you might not know is that behind 19 the scenes, some -- about -- depending on which country 20 you're in, about 0.15 percent of that transaction is 21 going to Apple, and in addition, it's actually not 22 possible to create a competing wallet on the iPhone, at 23 least not one that uses the NFC radio, which is part of

24 the receivers f w0r.bTwo0 Tm 00 actually

1	of the good guy on this particular issue and that you
2	can have multiple there's an NFC radio in the phone,
3	and the nonprice exclusionary provision, if you like,
4	which is present on the iPhone is that the only place
5	you can access the NFC radio is through the Apple
6	Wallet.
7	So anybody can use the flashlight, anybody can
8	access all the apps can access the maps or the
9	buttons, but there is one feature on the iPhone that
10	you can't access, and that's the NFC radio that's used
11	for payments. The only way an app can access the NFC
12	radio is through the Apple Wallet, and the only way a
13	card can go in the Apple Wallet is if you basically
14	share the interchange fee with Apple.
15	In addition, there are no-steering provisions.
16	So in particular, the credit card company cannot charge
17	the consumer more or affect merchants either to as a
18	result of this fee. So you can't tell the consumer,
19	hey, you have to pay a little more if you use the Apple
20	Wallet rather than your physical card, okay? So those
21	no-steering provisions make the consumer completely
22	insensitive to whether they use the phone or the card,
23	but it's imposing an additional cost on the system.
24	And so this comes back to platform competition,
25	

1 Apple and Google were competing for consumers, and so, 2 you know, if there's lots of great wallets and lots of 3 credit cards in wallets on the Android phones, then 4 maybe people will switch over to the Android and away 5 from their iPhone. 6 But the problem is that if you ask a consumer, 7 you know, would I switch phones because my CitiBank 8 Visa is not available in my Apple Wallet, but, you 9 know, my Chase Visa is, most consumers are not going to 10 switch phone operating systems over the availability of 11 a single card. 12 So in the end, the credit cards are now the 13 sad -- they're in the same position the merchants were 14 in the AmEx case, and they say, oh, gosh, what do I do? 15 If I don't go put my card in the Apple Wallet, then my 16 consumers will just use another credit card that is in 17 the Apple Wallet, so, gosh, the credit cards -- sort of 18 a prisoner's dilemma problem -- collectively they would 19 like to be able to negotiate with Apple to get that fee 20 down, but individually, none of them have enough power, 21 and so in countries where the banks are fairly --22 they're fragmented, like the U.S., they all just 23 capitulated and generally put the cards in the wallet 24 and paid the 0.15 percent. This is -- all the business

25 terms are confidential, so I just have read things from

1	news reports, but in other countries where the banking
2	system was more concentrated, they negotiated those
3	fees down a bit.
4	And, you know, broadly you might say the answer
5	ultimately should be that maybe countries should just
6	regulate that fee. So if you think about if you're
7	a country, not the U.S., that's not getting the benefit
8	of this Apple fee, and suddenly there's like a 0.15
9	percent tax on all transactions, you might just say
10	that's sort of too high, I don't want to regulate it
11	down, but we could also think about the role of
12	antisteering provisions in this type of case, and we
13	could also ask whether, you know, there's an antitrust
14	issue with basically locking down access to the NFC
15	radio within the platform, which is kind of a form of
16	exclusion.
17	So I'm not making a policy recommendation right
18	now as to whether this should be the antitrust law or
19	this should just be regulation of the financial system,
20	but it's a place where these economics, you know, come
21	into play, and, you know, we might say that that fee
22	sounds a bit inefficient.
23	MR. CONNER: Okay. I am going to turn to what
24	may be the last question, looking at our time, and I am
25	going to direct this to you first.

**75** 10/17/2018

- 1 there have been newspaper cases where courts, again,
- 2 around the world have differed in terms of how they
- 3 approach the market definition issue. A case that

- 1 AmEx case as well, that brings up a very important
- 2 issue about what's the relevant market here, because
- 3 the rest of the analysis seems to follow usually from
- 4 the market definition.
- 5 MR. CONNER: Susan?
- 6 MS. ATHEY: Yeah, so I think some of my
- 7 comments have already addressed some of these issues,
- 8 but I would say in ad-funded businesses, you need to
- 9 think specifically about the incentives the platforms
- 10 have, and so, like, say, going back to Google, which is
- 11 one of the most successful ad-funded platforms, why
- 12 does it want to -- why does it worry about, say,
- 13 competition from Amazon or another kind of -- maybe
- 14 think of them as a vertical competitor in some way,
- 15

- 1 sufficient advertisers to be profitable, and so those
- 2 scale dynamics can be pretty important.
- 3 MR. CONNER: Anything else? Okay.
- 4 There is a question from the audience.

5 Professor Athey gave an example where consumers will

- 6 not switch phone operating systems for the wallet
- 7 because phones are -- I'm sorry, phones are so many
- 8 products to us. What are some other implications of
- 9 this particular point?

10 MS. ATHEY: Yeah, so I think if you -- so,

11 again, the challenge -- and, you know, I thought about

12 this at some point when thinking about the viability of

13 a third mobile operating system, the question is, like,

14 is there some, you know, killer app on a phone that

15 would really -- if it was available on one phone and

16 not the other, it would really cause you to dump one

17 phone operating system and go to the other.

18 It just happens, in the case of phones, there
19 aren't a lot of apps like that, especially because you
20 can access services through the browser, so it's just
21 hard to have, like, the killer app on a phone that
22 would cause you to switch. And I would say I would
23 contrast that with video games, where, like, a hit

**80** 10/17/2018

**81** 10/17/2018

**83** 10/17/2018

1 If you think you have a great set of -- a suite 2 of services on your site and if you can just get the 3 consumer to come see how awesome you are, how great 4 quality you have, what great deals you have, then, you 5 know, trying to price very competitively on a product 6 that's very salient to a consumer, even pricing below 7 cost, could be a perfectly reasonable thing to do. 8 We don't worry about it in supermarkets too 9 much because we think that it's like -- those are 10 pretty competitive, so I think I would really look at 11 the facts of the case. I might think again if a person 12 that was doing it was so dominant that they were sort 13 of picking winners and losers or they were able to put 14 an entire company out of business or monopolize an 15 industry, that there certainly could be facts like 16 that, but broadly, you know, these -- I think these 17 kinds of loss leader types of strategies should be 18 expected, and they wouldn't, just on the face, be, you 19 know, necessarily a problem. 20 MR. CONNER: And Judy and then Tom? 21 MS. CHEVALIER: Yeah, I would just quickly say 22 that I think oftentimes a framing to think about this 23 kind of loss leader -- I've worked on supermarkets, so 24 I like that framing -- but I think another framing is

1	oftentimes the thing that you're you could be
2	preying on is really a feature you've put on a larger
3	product, and we have certainly we certainly expect,
4	as technology, you know, improves, that, you know,
5	there are features I used to buy separately for my
6	phone which now I just expect my phone to just have,
7	and I think we wouldn't actually want to stymy that
8	kind of change in the products, and so that's just
9	another framing to think about it.
10	MR. CONNER: Tom?
11	MR. BROWN: So I would say call a lawyer
12	admitted to practice in California and bring the case
13	under California's below-cost pricing statute.
14	MR. CONNER: Well, that's an interesting way to
15	end this panel, but we are out of time. So I do want
16	to thank everyone here for attending, those watching
17	online, I hope it has been informative, and most
18	importantly, I want to thank the five panelists for
19	their contributions. It has been certainly a very
20	interesting discussion. So thank you very much.
21	(Applause.)
22	(End Panel 1.)
23	
24	

**86** 10/17/2018

PANEL 2: UNDERSTANDING EXCLUSIONARY CONDUCT
 IN CASES INVOLVING MULTI-SIDED PLATFORMS: ISSUES
 RELATED TO VERTICALLY INTEGRATED PLATFORMS
 MS. BLANK: Good morning, everyone. After a

1	its global survey.
2	Next to Amy, we have Nicolas Petit, a Professor
3	of Law at the University of Liege in Belgium, a
4	Research Professor at the School of Law of the
5	University of South Australia in Adelaide, and a
6	Visiting Fellow at the Hoover Institution at Stanford
7	University.
8	Next to Nicolas, we have Robin Lee, an
9	Associate Professor of Economics at Harvard and a
10	Faculty Research Fellow at the National Bureau of
11	Economic Research. Robin previously served on the
12	faculty at NYU's Stern School of Business.
13	Next we have Susan Creighton, Co-Chair of the
14	Antitrust Practice at Wilson, Sonsini, Goodrich &
15	Rosati. Previously Susan also served as Director and
16	Deputy Director of the Bureau of Competition at the
17	FTC.
18	Finally, next to me, I have Lesley Chiou,
19	Professor of Economics at Occidental College. Lesley
20	was previously a visiting scholar at UCLA and at Boston
21	University.
22	And I should add, I'm Barbara Blank. I'm at
23	the Federal Trade Commission.
24	So I thought we would just get started, just
25	jump right into the panelists' prepared remarks, and we

1	are going to start this morning with Amy.
2	MR. RAY: Hi. Good morning, everyone. I will
3	use my introductory remarks primarily to address two
4	points. First, to set the stage for where we are with
5	respect to Sherman Act Section 2 enforcement in conduct
6	cases, and then second, to acknowledge that perhaps
7	appropriately there's a good deal of scrutiny on
8	competition on and among vertically integrated digital
9	platforms.
10	So, one, from a view outside the agencies,
11	here's one take on Section 2 enforcement. The last set
12	of monopoly conduct guidelines were withdrawn a decade
13	ago. The most recent major Section 2 conduct case
14	brought by the federal antitrust agencies was against
15	Microsoft. We look back to that 2001 D.C. Circuit
16	liability opinion in Microsoft as a beacon of the
17	agency's ability to tackle tough questions about
18	competition in the technology sphere, yet without
19	federal guidelines or Section 2 enforcement post
20	Microsoft, it might be fair to ask whether our current
21	antitrust law and economics toolkit are up to the task.
22	I'd respond to that last point in the
23	affirmative, given the flexibility inherent in
24	antitrust law, but perhaps the enforcement approach
25	could benefit from a bit of finetuning, especially as

1 new platform and aggregator technologies continue to 2 race forward in vertically integrating. 3 And by the way, I credit Ben Thompson, who was 4 a speaker during Monday's hearings, with putting 5 forward that term "aggregator." I think it's helpful 6 for the types of technology interdependencies we will 7 discuss during this panel. 8 So moving to my second point, these platforms, 9 or aggregators, find themselves under the enforcement 10 microscope. Echoing my own experience in going under 11 the hood in these types of matters, we need to 12 appreciate both how network effects and platform 13 durability contribute to market power. In unpacking 14 the underlying structure of competition and technology 15 markets, retrospective studies can be helpful to the 16 Commission. 17 That said, we should be cognizant that history 18 might not capture the dynamism of today's digital 19 marketplaces and the ways in which network effects can 20 be combined with conduct to undermine competition; for 21 instance, in preventing other disrupters from reaching 22 efficient scale. 23 As just one example, perhaps we can distinguish 24 the historical poster child for efficient vertical 25 integration, the A&P Grocery Store. It faced

1	competition given that "entry into the food trade was
2	so cheap and easy and that any attempt to raise prices
3	would immediately have resurrected competition."
4	That's quoting from Martin Adelman's book. Can the
5	same be said about digital marketplaces? Well, let's
6	consider a few things.
7	The availability of behavioral data, which we
8	assume is captive to the platform operator and
9	aggregator only, that allows for precise targeting of
10	customers for its own products. Then combine that
11	ability to target conferred by behavioral data with the
12	incentive a vertically integrated aggregator has to
13	preference its own offerings.
14	For applicable law, we can look back to the
15	computer reservation system cases and related DOJ
16	commentary. I have a feeling some other panelists may
17	talk about that as well. I'll just read from a 1988
18	Central District of California opinion. "Display
19	biasing is unreasonably restrictive of competition in
20	that it restricts competition on the merits in the air
21	transportation business, and this type of competitive
22	advantage depends upon the perpetration of a fraud upon
23	the consumer. It is unreasonable and, therefore, an
24	unwarranted competitive advantage because it inhibits
25	competition on the merits."

1	Also in digital marketplaces, multihoming
2	evidence should receive due weight in assessing
3	competitive effects. To what extent do or don't market
4	players multihome and why? Moreover, we're in an era
5	in which platform aggregators often compete for a
6	market in winner-take-most scenarios. It has been
7	acknowledged that this type of aggressive competition,
8	incentivising monopolies, has produced some of the most
9	spectacular innovations we enjoy today. We, however,
10	should also account for subsequent reduced innovation
11	effects when a monopolist acts to raise rivals' costs,
12	to raise barriers to entry, and thereby to entrench its
13	market power.
14	Let me propose one data-related hypo to you.
15	Suppose a platform operator opens its data to retailers
16	on its platform to help them refine their products to
17	suit the tastes of customers in a market. It then
18	commits to work with massive market research firms to
19	offer the retailers even more thorough analyses of how
20	to delight those customers.
21	That example is actually not apocryphal. It
22	describes what Alibaba did when it demonstrated to Mars
23	that Chinese snackers prefer a Szechuan spicy flavor
24	called mala. Mars then introduced a new product for
25	the Chinese market that is now a wildly popular spicy

- 1 Snickers bar.
- 2 Of course, Alibaba is not -- is a nonintegrated
- 3 platform. Now, does a vertically integrated platform
- 4 aggregator have the incentive to share that data? If
- 5 not, and it opts not to introduce the innovation, that
- 6 innovation may not come to market. You and I, sadly,
- 7 might never devour a spi5 23miglp508.9ed2

1	mind-set on competition. "Antitrust is a deregulatory
2	philosophy. If you're going to let the free market
3	work, you'd better protect the free market."
4	MS. BLANK: Thank you, Amy.
5	Next we will hear from Hal, who will come up.
6	MR. SINGER: I don't have any slides, but I
7	understand that a speech needs to be delivered from a
8	podium. Thanks for having me, Barbara. Thanks for
9	having me, Derek and the FTC.
10	Dominant tech platforms have the incentive and
11	ability to leverage their platform power into ancillary
12	markets by vertically integrating and then favoring
13	their affiliated content, applications, or wares with
14	their algorithms and basic features. A platform owner
15	should be concerned for the overall health of its
16	ecosystem, which in theory should discourage it from
17	squeezing complementers, but that calculus goes awry
18	when a platform enjoys monopoly power and can take its
19	customers for granted.
20	Dominant tech platforms can also exploit the
21	vast amounts of user data made available only to them
22	by monitoring what their users do both on and off their
23	platforms and then appropriating the best performing
24	ideas, functionality, and nonpatentable products

25 pioneered by independent providers. If these practices

- 23 globally.
- 24 In contrast, VC investing outside of tech
- 25 increased over that same period, suggesting the problem

the	

2 PitchBook data reveals that broadly defined indust 3 in which Amazon, Google, and Facebook -- inside the 4 Amazon, Google, and Facebook orbit -- experienced a 5 collapse in venture capital first financing since 2015, 6 a reduction not observed in comparable tech sectors. 7 There are three basic approaches to dealing 8 with this threat to edge innovation. First, we could 9 lean on antitrust enforcement to police discrimination 10 pursuant to the consumer welfare standard. Second, we 11 could police these episodes on a case-by-case basis 12 pursuant to a nondiscrimination standard. Or third, we 13 could erect structural barriers via legislation to 14 prevent dominant platforms from annexing ancillary 15 markets. 16 I am on Team Nondiscrimination, but before I 17 defend its merits, let me briefly discuss the demerits 18 in the approaches of Team Antitrust and Team Structural 19 Relief. The antitrust path leads to underenforcement 20 because judges increasingly interpret the consumer 21 welfare standard to require demonstration of a

might be tech-specific, and new research using

1

2 by the time relief could be administered. On the other 3 side of the spectrum, structural separation is a messy 4 undertaking. How one draws the boundaries around a 5 platform's core mission is not straightforward. Not 6 all ancillary offerings require the same level of 7 ingenuity and creativity, and, thus, not all verticals 8 present the same welfare tradeoffs. Barring Google 9 from incorporating a commodity feature, such as 10 answering a math problem, while beneficial to rival 11 math apps, would likely reduce the welfare of users in 12 the short run without any offsetting innovation game. 13 Finally, structural separation can always be 14 imposed after less invasive behavioral remedies have 15 been deployed without success. The problem from an 16 economic perspective is not vertical integration, per 17 se. The problem arises when vertical integration is 18 followed by discrimination in a vertical that entails 19 innovative or creative energies; that is, in verticals 20 where the best source of innovation is likely to come 21 from independents. 22 Under a nondiscrimination regime, Amazon would 23 be free to sell private-label mass, and Google would be 24 free to collect and attempt to organize its own

25 restaurant reviews, but as soon as these platforms

96 10/17/2018

1	vertically integrate, they would be subjected to a
2	nondiscrimination standard. This standard would be
3	enforced via a complaint-driven process initiated by
4	the party alleging discrimination. The standard would
5	prevent Google from limiting its search results for
6	local doctors or local restaurants to Google-affiliated
7	content. Instead, Google would be required to run its
8	page rank algorithm across the entirety of the public
9	web for local searches.
10	Under a nondiscrimination standard, a
11	vertically integrated Google could discriminate in its
12	organic search results in every dimension, save one,
13	whether the results are affiliated with Google. An
14	added benefit of my approach is that it borrows from
15	the solution to a nearly identical problem concerning
16	vertical integration by a dominant platform in the late
17	1980s and early 1990s.

**98** 10/17/2018

**99** 10/17/2018

1	Now, this is a setting I'm sure many are familiar with
2	given recent events. Essentially, there are upstream
3	channels, here in orange, that have to contract with
4	downstream distributors, in blue, to access customers.
5	What do we do in this paper?
6	Well, I, along with several co-authors,
7	including Greg Crawford, Mike Whinston, Ali Yurukoglu,
8	build and estimate a bargaining model in the cable
9	industry in order to quantify the pro and
10	anticompetitive effects when high valued content
11	here regional sports networks, or RSNs vertically
12	integrate with distribution.
13	Now, I think multichannel television is a nice
14	industry to start with because the efficiency and
15	foreclosure effects here are present in many other
16	platform environments. In particular, the efficiencies
17	that we measure and focus upon include the standard
18	elimination or reduction of double marginalization, as
19	well as the better alignment of incentives regarding
20	strategic actions. Here, those strategic actions
21	include increased carriage of integrated content, but
22	in other industries, could include R&D and investment.
23	The anticompetitive effects we're going to
24	focus upon include these foreclosure effects, primarily
25	downstream foreclosure, by which we mean an integrated

1	content provider either completely excludes or
2	disadvantages rival distributors when it comes to
3	carrying its programming. This includes raising
4	rivals' cost effects.
5	Now, what we do is we simulate vertical mergers
6	and divestitures for approximately 30 RSNs in our
7	sample period, which is in the mid-2000s, and our key
8	findings are that, on average, across channels and
9	simulations, there is a net consumer welfare gain from
10	integration. Don't get me wrong, there are significant
11	foreclosure effects, and rival distributors are harmed,
12	but these negative effects are oftentimes offset by
13	sizeable efficiency gains. Of course, this is an
14	average. It masks considerable heterogeneity. When
15	complete exclusion occurs, which happens both in our
16	simulations and in the data some of the times, consumer
17	welfare is actually harmed. And this suggests that in
18	
19	
20	to other distributors, actually helped consumer
21	welfare.
22	
23	
24	

1	think this may be less of a concern here due to the
2	presence of program carriage rules; however, these
3	rules don't eliminate all potential harm. For example,
4	consider the channel neighborhooding requirement
5	imposed for the Comcast-NBCU merger.
6	Second, this paper measures really the static
7	effects of integration and doesn't capture long-term
8	effects on entry, exit, investment, and so forth, which
9	can be significant. For this we would probably like to
10	complement it with some kind of dynamic analysis, and
11	to do this, I'm going to sort of highlight another
12	paper of mine that looks at a somewhat more dynamic
13	

1	have small short-run effects but very large long-term
2	effects. Here, without subsequent entry by successful
3	platforms, prices would have been higher, and
4	industrywide quality and software development likely
5	reduced over time.
6	Now, these similar findings about the benefits
7	of platform competition exist elsewhere. For example,
8	in a related study in television markets, Economists
9	Austin Goolsbee and Amil Petrin measured consumer
10	welfare gains from the entry of satellite television
11	distribution to be on the order of billions of dollars
12	per year. Thus, although facilitating competition
13	within platforms for complementary products is
14	desirable, this suggests that cross-platform
15	competition can be just as, if not more so, more
16	important.
17	And one last point before concluding. I think
18	Amy touched on this point as well. In this industry,
19	multihoming is really important to consider. Here, the
20	heaviest users and the source for most industry
21	revenues, they bought multiple platforms, and I bring
22	this up because the extent to which consumers can
23	multihome matters for how platforms compete. For
24	example, if you're a platform, you don't really need to
25	access all complementary products to be successful.

1	All you really need to do is offer a compelling set of
2	certain products to get some multihoming consumers on
3	board.
4	Similarly, any product can potentially be
5	brought to market and be successful even if it's
6	excluded from one or several platforms. So on that
7	point, I'd like to pass it along to the next panelist.
8	Thanks.
9	MS. BLANK: And we are going to move on to
10	Lesley.
11	MS. CHIOU: Okay. So, yeah, it's wonderful to
12	be here, and I'm looking forward to our panel
13	discussion. So in the spirit of Robin's remarks, I
14	will also put on my academic hat and use the next few
15	minutes to share some of my research that I've done on
16	platform markets. In particular, I want to talk about
17	two papers. The first looks at a platform introducing
18	new products, and the second looks at a platform
19	copying content from other sites. And in both papers I
20	find that this type of platform content can have
21	significant consequences for the use of third-party
22	sites by consumers.
23	Okay, so my first paper in the Journal of Law,
24	Economics, and Organization, I'm looking at whether or
25	not or actually how a platform introduces or integrates

1	product into its particular platform. So in this case
2	I'm looking at search engines. So if you have your
3	laptops handy or, you know, your cell phones, feel free
4	to pull up Google, and you can sort of look along.
5	Just do a keyword search for flights to D.C., and
6	you'll see in this case that you'll get a set of search
7	results, and they'll have links to various online
8	travel agencies, like Expedia, Travelocity, and you'll
9	also see as well Google's own product, Google Flights.
10	So the question I'm interested in is, you know,
11	how does the integration of Google's own products, in
12	this case Google Flights and at the time Google Zagat
13	restaurant ratings, how does that affect the use of
14	third-party sites? So, what happens to Expedia and
15	Yelp?
16	And so my results actually show two opposing
17	findings. So, the first is that when Google integrates
18	Google Flights, what happens is that a usage of online
19	rival travel agencies decrease, but on the other hand,
20	the integration of Google's Zagat ratings actually
21	increases the use of other review sites on Google.
22	And so, in other words, what this is saying is
23	that Google Flights is serving as a direct substitute
24	or a direct rival to other online travel agencies,
25	while Google Zagat restaurant ratings are actually a

1	complement towards other review sites. So it seems
2	that, you know, the consequences for third parties
3	really matter whether you're looking at consumers
4	searching for quality information or pricing
5	information. And so I'll circle back more to this
6	after I talk about my second paper.
7	So, in my second paper, so this is joint work
8	with Catherine Tucker in the Journal of Economics and
9	Management Strategy, and we're interested in looking at
10	what happens when a platform copies content from
11	another site. And so, in particular, we're interested
12	in how a news aggregator, like Google, functions when
13	it shares headlines or short extracts of articles from
14	other news sites.
15	And so what we find is that when there's a
16	sudden and large removal of news content from this news
17	aggregator, this actually leads to a sharp decline in
18	consumers' visits towards other news sites from Google,
19	all right? So, in other words, Google News here is not
20	serving as a rival to other news sites or as a direct
21	substitute, but, rather, it's serving as an upstream
22	referral to these sites. And, in fact, in particular,
23	what we find is that consumers tend to use these news
24	aggregators to locate information that they might not
25	otherwise find, so content that is more unusual or more

1 niche, more highly localized news.

2 And so if you take these two papers together, 3 what this is showing really or what this suggests is 4 that platform integration of either its own products or 5 content can really shift consumers' use of third-party 6 sites. So when consumers are looking for or exploring 7 information that is more unknown, so perhaps looking 8 for a restaurant they haven't visited or today's news, 9 this type of platform content can enhance the use of

- 10 third-party sites.
- 11 On the other hand, when consumers are looking
- 12 to confirm prices or perhaps to make a purchase, this
- 13 type of platform content can have a negative
- 14 consequence for rivals, all right? So, thank you, and
- 15 I'm looking forward to our panel discussion.
- 16 MS. BLANK: Thank you, Lesley.
- 17 Nicolas?
- 18 MR. PETIT: Sure. Thank you, Barbara, and
- 19 thanks again for the invitation by the FTC. It's a
- 20 great opportunity to talk about great topics.
- 21 So I'd like to give a bit of context and then
- 22 make two general remarks on the topic. So the context
- 20

1	which are made. The first involves leveraging conduct,
2	where the platform gives preferential access display or
3	placement to its own products or services at the
4	expense of rivals. The second family of claims
5	involves vertical integration itself, so the platform
6	would sort of undertake aggressive M&A or copycat
7	innovation to squash actual or potential competitors.
8	So this is a sort of standard Amazon story, uses data
9	on merchants or from merchants to favor its own
10	businesses. It's like, you know, in the X-Men, there
11	is a character, I think it's called Rogue, and it can
12	absorb other mutants' powers just like that. So it's a
13	bit the same sort of thinking.
14	So with that in mind, the first high-level
15	remark that I'd like to make is that I think antitrust
16	could better acknowledge that the social costs of
17	vertical exclusionary conduct by platforms is
18	risk-class dependent. So what I mean by that, that
19	harm to consumer welfare is higher when we see
20	exclusion of firms with a cross-platform threat kind of
21	potential.
22	By contrast, the harm resulting from the
23	exclusion of harms without disruptive potential should
24	be a lesser concern for antitrust policy. So there is
25	nothing groundbreaking in what I'm saving here, but my

25 nothing groundbreaking in what I'm saying here, but my

1	perception of the current conversational framework is
2	that we are not quite seeing that discussion or that
3	distinction. We talk about whether to protect inter
4	versus intraplatform competition. We talk about
5	substitutes versus complementer competition. We talk
6	about remedies between platform and edge innovators.
7	That framing is not necessarily useful, because risk
8	classes are independent from these concepts, and real
9	platform threats can come or not from those substitutes
9 10	and edge products.
10	So Microsoft Bing, for instance, the
12	complainants in the leveraging case in Europe and
13	elsewhere against Google Search, strong interplay from
14	competition, not sure that this represented platform
15	threats for Google.
16	Diapers and batteries, intraplatform
17	competition to Amazon or edge competition, is this
18	real is there a real risk of platform threats
19	through those kinds of products and services, I'm not
20	too sure about it.
21	And so what I want to say is we risk missing
22	the real big thing here if we are basing enforcements
23	on the basis of frameworks, which are not actually
24	helping us distinguish between the real platform
25	threats, which is a sort of, you know, big consumer

- 1 harm type of category, versus the lesser harmful type
- 2 of anticompetitive conduct.

3 So to be a little concrete, the law sometimes 4 draws a distinction, and we heard yesterday on the 5 panel on the Microsoft case, that the Microsoft case 6 was a lot about platform threat type of conduct and 7 applications barriers kind of threats. We also know 8 that the U.S. Merger Guidelines tell us that mergers 9 can reduce competition when they eliminate a maverick 10 company. So I think antitrust policy could perhaps go 11 a little further and think about drawing the full 12 consequences of the various types of risks of 13 foreclosure when it designs priority -- a priority 14 agenda or tests or rules and standards for enforcement, 15 and, for instance, you can say we are going to 16 prioritize cases which involve real threats of platform 17 disruption versus cases which do not really represent 18 that type of risk for market competition. 19 All right, so that brings me to my last point 20 and my last remark. So I read a lot of work being done 21 on platform-specific harms to competition, and I read 22 much less work on platform-specific vertical 23 integration efficiencies, and I'm not talking here 24 about all the efficiencies that we know from the econ 25 literature about, you know, preventing holdup, reducing

1 double marginalization, and that sort of stuff. I'm 2 talking about things which are read in sort of, you 3 know, management or, you know, startups kind of 4 literature, and so in those books, there is a lot of 5 interesting material. 6 So in the tech world, there's sort of received 7 wisdom concept, which is adding verticals, adding 8 verticals is a sort of recent concept, and it's a 9 concept that people talk about when they're talking 10 about growing a company. So in the growth stage, 11 platforms also use adding verticals as a strategy to 12 accelerate customer acquisition. So Facebook, for 13 instance, invested multi -- invested a lot of money in 14 acquiring multiple companies for email scraping 15 purposes to be able to find out the people to invite to 16 the service. 17 E-companies like Amazon, for instance, started 18 in one segment, like, you know, e-books in 1997, and at 19 very quick pace added on music and video, adding 20 verticals, or, you know, the same with Uber and Lyft, 21 adding eats and scooters and other kind of verticals. 22 So when firms add verticals as part of their growth 23 strategy, the real hot question for antitrust is the 24 following: So we may welcome adding verticals as a

25 growth monetization strategy for startups, but should

1	we change the assessments for firms that are no longer
2	startups, like incumbent platforms? And when should be
3	the tipping point where adding verticals no longer is
4	legitimate?
5	So in this discussion, you also have to bring
6	into the mix the thinking about the fact that late
7	entry is often the sort of norm in the tech industry
8	and often a source of efficiency. Think about Google
9	entering mobile OS or think about maybe Amazon today
10	trying to enter some verticals because maybe things
11	that the verticals on the platform do not do good
12	service to customers.
13	Now, I just want to close with one last
14	statement. This concern about adding verticals may not
15	be you know, and this efficiency about adding
16	verticals may not be so pertinent in technology areas
17	where you have a lot of ex ante coordination, for
18	instance, in standard-setting organizations, where you
19	can clear all the sort of details through an ex ante
20	trial and error process and discussion within industry.
21	But in industries like the tech industry we're
າາ	talking about today, there is no such process, and so

- 22 talking about today, there is no such process, and so
- 23 it may make sense to let companies add verticals later

## 1 value for money. Thank you.

- 1 separate components, such as CPUs and disk drives. So 2 this integration eliminated a lot of cables and wiring, 3 but it also hurt the business of competing peripherals 4 manufacturers. 5 The first Microsoft case, people tend to 6 forget, prohibited the tying of Microsoft's MS-DOS with 7 its Windows 3.1 windowing software, but expressly 8 permitted their integration into Windows 95, and so on. 9 So apart from the cases, if you -- sort of the 10 things that didn't get challenged or didn't become 11 famous in the antitrust world, you see even more 12 examples of platform competition through product 13 integration. 14 I mentioned yesterday, David Evans has a nice 15 summary of the history of portal competition among the 16 major portals, AOL, Yahoo, and MSN in the '90s and 17 early 2000s, to illustrate how adding features is often 18 how platforms compete with each other. As Dr. Evans 19 noted, that portals competed intensely by adding 20 features such as email, messaging, search, news, 21 shopping, sports, maps, video, and travel. Some of 22 those may sound like platforms today. They were 23 verticals then. 24 On the hardware side, Apple innovated on its
- 25 iPod platform by adding mobile telephony and internet

1	reflected that state of the law even with dealing with
2	fencing-in relief to cure alleged antitrust violations.
3	Just to give one example from the FTC's history, I'd
4	point you to Section 5 of the FTC's 2010 Intel consent
5	order. So this is in the context of, even with
6	fencing-in relief, it expressly permitted Intel to make
7	design changes to its product that would "improve its
8	performance, operation, cost, manufacturability,
9	reliability, compatibility or intraoperability" even if
10	those changes degraded the performance of a
11	competitor's product.
12	Second, the courts and most expressly in the
13	D.C. Circuit's two Microsoft decisions, they have
14	recognized that it's a mistake to apply a
15	backwards-looking assessment of market demand and
16	market definition in the antitrust assessment of
17	product integration in platform markets.
18	So in Microsoft, this actually arose first in
10	the first concept degree ages. We didn't really apond

19 the first consent decree case. We didn't really spend

1	half, because I think that consent order was from '93
2	or '94, like the Intel 2010 consent order, and in that
3	case the D.C. Circuit was wrestling with what did
4	"integration" mean, since it was dealing with sort of
5	the combination there of Windows 95 with the browser,
6	and the Court observed that integration implies the
7	combination of things that specifically were separate,
8	but then it rejected the notion that it would make
9	sense to apply tying laws, backwards-looking separate
10	demand test, in those circumstances, precisely because
11	sort of the kind of thing that Robin was flagging.
12	It effectively penalizes the first firm to
13	innovate by combining what previously had been two
14	separate features. I think maybe Susan I think it
15	was Susan or Judy mentioned on the last panel sort of
16	using it on her phone, previously so, you know,
17	having functions that previously were separate, and
18	then she was you know, sort of they just came with
19	the phone.
20	So the example the Court gave, which I
21	particularly enjoyed, was they said, "Just because
22	Kodak recognized separate markets for parts and
23	service, that should not make a self-repairing copier
24	an unlawful tie."
25	So as we talked about yesterday, the D.C.

- 1 Circuit, in its subsequent Microsoft Section 2 case,
- 2 used that same kind of rationale to reject the idea of
- 3 applying a Section 1 per se tying analysis to platforms
- 4 precisely because of the ubiquity of this bundling and
- 5 the pervasively innovative character of platform
- 6 software markets. I think it's the kind of -- sort of

- 1 welcome for those in the copier servicing business. 2 MS. BLANK: Thank you, Susan. As would I, by 3 the way. 4 So thank you so much to all of the panelists. 5 We are going to move on to questions, and one 6 housekeeping note, as with the first panel, there 7 should be FTC staffers walking around with notecards, 8 and please feel free to take one and write down a 9 question for the panelists. 10 With that, though, before we move on to 11 questions, I wanted to give everyone a chance to 12 respond to any of the introductory remarks by other 13 panelists, if there are any. 14 MS. CREIGHTON: Actually, Barbara, sorry to 15 pile on, having just finished, but I did -- I thought 16 it was interesting, just as we go forward, to think 17 about what Lesley's research and kind of in light of 18 what Robin's research showed, just, for example, on 19 the -- just to pick one of her examples on the flight 20 search, because, you know, I think if you pick up on 21 something that Michael Salinger had mentioned, he said, 22 you know, there is no such thing as a general search, 23 and sort of this goes to the point about the importance 24 of multihoming.
- 25 I think most people in 2010, if they were

1	asked, hey, let's you know, why don't you do a
2	search for what flights you want, the first place you'd
3	think of probably to go would have been Expedia, and
4	then maybe Travelocity after that, and then maybe, I
5	don't know, you would think of Google, but you wouldn't
6	kind of have very much in the way of expectations of it
7	being producing a very good effect.
8	So another way of interpreting Lesley's sort of
9	findings is that sort of Google adding those flight
10	search capabilities actually was enhancing competition
11	to what was then sort of the dominant Expedia, and so
12	the substitution effect she found is exactly what we
13	would be hoping sort of that you would be seeing in
14	terms of interplatform competition.
15	So I'd just point that out in light of, you
16	know, sort of like Robin's example of Microsoft
17	competing against Sony. It's worth thinking about sort
18	of the you know, I think the empirical economic
19	research is great, and it's wonderful to be seeing the
20	results, to be kind of thinking about sort of what
21	sort of as we're framing our questions, not to be
22	getting into sort of an assumption, which I don't think
23	either Lesley or Robin were suggesting, but that sort
24	of, like, somehow in a you know, we live in a

1	getting into a world of sort of assuming that everybody
2	competes on a platform and then another platform and
3	then another you know, that that can be a constraint
4	that I don't think necessarily reflects how people's
5	consumer behavior actually is.
6	MS. BLANK: Thanks. I appreciate that.
7	Actually, on that note, you, Nicolas, and several
8	others, Lesley and Robin, all referred to this kind of
9	adding of verticals and whether adding verticals and
10	integrating technologically somehow is how we should
11	classify that, and with apologies to Nicolas, I
12	hesitate to admit with him sitting here at the table,
13	that we at the FTC and me, in particular spend a
14	lot of time thinking about what we know as
15	interplatform competition versus intraplatform
16	competition, where verticals are added to a platform.
17	Now, I know some argue that that's a false
18	divide or we shouldn't think about things that way. Of
19	course, Susan referenced the Microsoft decision. There
20	was a whole panel yesterday on the Microsoft decision.
21	Microsoft, in my interpretation, really did focus on
22	that question, the idea that these verticals, the
23	Netscape navigator, the Internet Explorer browser, were
24	these vertically integrated products, but the D.C.
25	Circuit focused not on the tying and dominance in this

- 1 downstream market -- certainly the DOJ brought that
- 2 claim -- but, rather, the impact of that tie on the
- 3 upstream operating system market, and the first
- 4 panel -- I wasn't going to raise AmEx, but I'm crazy,
- 5 so I will.
- 6 The first panel spent a lot of time on AmEx,
- 7

- 1 websites on Google, between merchants on Amazon, or
- 2 Apple's vertically integrated products versus a
- 3 rival -- versus a downstream rival, or is the only --
- 4 or is the only real issue in a case whether we can
- 5 prove interplatform competition -- evidence of
- 6 interplatform competition harm.
- 7 Anyone who wants to answer.
- 8 MR. SINGER: I'll take it.
- 9 MS. BLANK: Please, Hal.
- 10 MR. SINGER: So, you know, I actually think
- 11 that the question is premised on a false assumption of
- 12 interplatform competition. I think competition among
- 13 the platforms here is exceedingly weak. I don't think
- 14 from a consumer's perspective or a user's perspective
- 15 you would view what Google is offering in terms of
- 16 search to be a reasonable substitute to what Amazon is
- 17 offering in terms of e-commerce or what Facebook is
- 18 offering in terms of social media.
- 19 In fact, this competition is so weak that
- 20 Google, I think last week, finally pulled out of the11

1	in summary, that harm to innovation at the edge is a
2	worthy policy objective, and it should be pursued and
3	policed by the agencies.
4	MS. BLANK: Please.
5	MR. PETIT: Thank you, yeah. I just want to,
6	you know, think about this concept of interplatform
7	competition. I mean, what are we what kind of
8	platform competition are we talking about? Do we want
9	five search engines competing against each other, five
10	OS for mobile, do we want six competing email services?
11	I mean, are these really, you know, the social optimum
12	that we want? I'm not too sure.
13	I think what matters is to understand that
14	interplatform competition in tech doesn't really occur
15	in the core market functionality where the incumbent is
16	present, and so once you sort of start thinking this
17	way, you think about the fact that interplatform
18	competition is not horizontal, but sort of adjacent.
19	So, you know, the battle for the user interface is a
20	good example, where you've seen generations of user
21	interface applications replacing each other, and that
22	battle for, you know, being the prospective platform is
23	why it is interplatform competition instead of
24	horizontal competition for, say, search or email
25	functionality or personal social network.

1	And I think as long as we have a healthy degree
2	of adjacent interplatform function by the meaning that
3	I just mentioned, where some people see kill zones, I
4	think a lot of people see opportunities. So you could
5	think that, you know, a monopoly in the platform market
6	that you're looking at is not really a kill zone but a
7	lighthouse, which tells entrepreneurs where they should
8	not invest and deflects effort towards trying to
9	envelop, bypass, leapfrog or, you know, just sort of
10	obsolete the platform that you are talking about. And
11	I think we don't, in the antitrust world, manage to
12	capture that source of competition, which is
13	prospective in nature.
14	MS. BLANK: Anyone else?
15	MR. LEE: I'll make one point. If we sort of
16	adopt this intra versus interplatform framework and,
17	Barbara, you alluded to this as well, I think it's a
18	nice point to make that even if it appears that
19	interplatform competition is relatively robust, there
20	are several platforms, you want to think about the
21	possibility that intraplatform harm can lead to harm or
22	softening of interplatform competition.
23	For example, if you have a platform that, let's
24	say, makes its customers more reliant on integrated or
25	exclusive products by perhaps disadvantaging rivals or

1 not providing products served by rivals, you might be 2 increasing switching costs, lock-in, and so on and so 3 forth. So although something may look reasonable right 4 now, over time, the situation could change. So I just 5 wanted to sort of bring that point up again. 6 MS. CREIGHTON: Yes. So, Barbara, I agree --7 well, I mean, I agree with you on your characterization 8 of the Microsoft case, and I do think it was -- the 9 theory of that case really was the harm to -- it can be 10 to a product that's an intraplatform product, so, you 11 know, like when Microsoft misled the app developers 12 over polluted JAVA, you know, that was a harm to JAVA, 13 but the point was sort of creating the harm to the 14 interplatform competition, and that was definitely, you 15 know, I think the -- you know, it was interesting 16 hearing that, you know, sort of in -- in the Microsoft 17 case in the U.S., you know, the Department of Justice 18 didn't even challenge the idea of the dominant firm 19 bundling and giving away for free and making a default 20 its browser, which by comparison is the Android case in 21 Europe. 22 So what was sort of not even challenged in the 23 U.S., you know, we heard was sort of the basis for 24 liability in Europe, but what was the real focus in the 25 U.S. case was sort of real, kind of early recognition

1	of the importance of multihoming, was the restraints
2	that were adding on top of that, preventing users and
3	the OEMs from being able to allow switching and allow
4	multihoming.
5	And so those are I think those are a great
6	example of what you were talking about, about that's a
7	vertical restraint, but its harm was impairing the
8	multihoming and the switching that would have
9	facilitated the interplatform competition.
10	MS. BLANK: Thank you.
11	Related, one commentator, Stacey Mitchell, who
12	must have been very busy, because I heard her name come
13	up in the first panel as well, she submitted a comment
14	from the Institute of Local Self-Reliance, submitted
15	another public comment, also about Amazon I think
16	the comment in the first panel was about Amazon as
17	well stating that Amazon uses its dominant
18	gatekeeper position to undermine competition from rival
19	retailers and manufacturers that depend on its platform
20	to reach the online market, citing examples such as
21	Amazon taking retailer data on consumers and using it
22	to launch its own products or to preference those
23	products ahead of rivals.
24	The European Commission has also reportedly,
25	according to news reports, launched an investigation

1	into these practices. This goes to the heart of what
2	we were just talking about, a platform investing in
3	verticals or preferencing its own content and how we
4	think about those downstream issues. How should the
5	U.S. antitrust agencies look at this issue?
6	If I can start with Lesley?
7	MS. CHIOU: Sure. So, yeah, I haven't looked
8	at Amazon specifically. From my research on search
9	engines, you know, I can hypothesize that there are a
10	couple of things to keep in mind. So the first point
11	is actually something that Susan Athey spoke about in
12	the prior session, about this type of preferencing
13	serving as nonprice predation, so in a way in which you
14	can have a short-term sacrifice for a long-term gain.
15	So maybe in the short run, downranking or downgrading a
16	high-quality site or a high-quality seller on your
17	particular platform, with the hope of recouping in the
18	long run.
19	I think a second thing also to keep in mind is
20	really how consumers are using the platforms, because
21	this can help identify situations in which, you know,

we m0 Tq w1out inhigr dowing00011 Ta lity Tc dow--wngrading a14

1	Commission says that the problem that Google denied
2	equality of opportunity to competing products, it sort
3	of, you know, cured the air supply. That's it.
4	So you don't find the sort of, you know, fancy
5	IO language of stability and incentives to foreclose
6	secondary markets. Nothing of that appears in the
7	opinion, and you don't find the you don't find the
8	words "leveraging" in the European Commission decision.
9	There is no no such thing there. So I think it's
10	fair to say, on the basis of that case and that
11	reasoning informs what the Commission do will do in
12	the Amazon investigation, that you can actually move
13	quite fast to find liability under Article 102 in such
14	cases.
15	MS. RAY: All right. And I'll just add that,
16	you know, if it's the case that Google was preferencing
17	its own verticals above those that were of lesser
18	quality and applying the scores to punch down the
19	results of competitors, looking at U.S. law, that's
20	probably cognizable as a consumer harm under the
21	consumer welfare standard.

22

1	the FTC's findings, where the conclusion was, as I've
2	mentioned before, I think, sort of really the clear law
3	in the U.S. is that if you have a product design and it
4	benefits consumers, that's pretty much the end of the
5	story.
6	Google competed you know, its argument in
7	the E.U. was not that it was trying to compete with
8	DuckDuckGo but that it was trying to compete with
9	Amazon, and so the you know, what the defense was
10	that the Google was trying to improve its product
11	relative to Amazon, and I think, as Nicolas was
12	suggesting, I think really the EC's concern was that
13	not even effectively stipulating that that were the
14	case, that there could still be quality of opportunity
15	problems with that. I think that's a pretty
16	fundamental difference between the two jurisdictions,
17	but
18	MS. BLANK: Okay, thank you.
19	So we've spent a lot of time this morning
20	talking about Google, Amazon, I've heard Facebook
21	mentioned, and in the first panel as well. We
22	haven't Susan Athey mentioned Apple for a brief
23	second in the first panel, and, of course, the biggest
24	difference between Apple and Google and some of the
25	others is that Apple is, of course, a closed platform

- 1 from soup to nuts. It manufactures its own hardware.
- 2 It puts its own software. It is not an open system
- 3 under any sense of the word.
- 4 Is there something unique about a closed
- 5 platform like Apple, or to a lesser extent Facebook,
- 6 that makes preferencing one's own content or
- 7 integrating or these kinds of vertical integration
- 8 issues we've been talking about today less harmful?
- 9 Please, Hal.
- 10 MR. SINGER: Well, while I'm making friends
- 11 with the platforms, I'll pick on Apple as well. Apple
- 12 would not be immune from this nondiscrimination regime
- 13 that I am pitching, and I think that you can -- you can
- 14 understand what Apple is doing on its app -- in its app
- 15 space to be very similar to what the other platforms
- 16 are doing that I discussed earlier.
- 17 There was an old case regarding Google Voice,
- 18

4	our Oall actually the undet that a set of discrimination
1	own. So I actually thought that sort of discrimination
2	in favor of your own app would lend itself very
3	naturally to the nondiscrimination regime that I have
4	in mind.
5	And then, you know, finally I'll just say that
6	I think there's something to be said for regulatory
7	symmetry. I wouldn't want to peddle a regime that
8	would uniquely pick on Google. I think that I think
9	that it's important that whatever whatever set of
10	rules that we come up with at the end of this ought to
11	apply equally to all the platforms, and so, you know,
12	it's important that it that both Google, Apple,
13	Facebook, and Amazon would be subject to these sorts of
14	complaints.
15	MS. CREIGHTON: So I just I wanted to
16	quarrel with the hypothetical a little bit or the
17	premise or something, because it might help, just in
18	terms of how we think about platforms, that, you know,
19	like if you just take iPhones and Android devices, for
20	example, neither Apple nor Google make their devices,
21	so Apple uses what are called ODMs or original design
22	manufacturers, while Androids are made by OEMs, and in
23	some ways that distinction is more about contract terms
24	than anything, because the same company can be an ODM
25	for one customer and an OEM for another customer.

1	So the difference really relates to the degree
2	to which the company that makes the device is given a
3	specified design. So whichever model you're following,
4	how much flexibility you can give can vary. So, like,
5	Microsoft followed an OEM model with desktops but
6	didn't give its OEMs very much flexibility. So there's
7	sort of this range here, and I think, maybe to pick up
8	on Hal's point from a slightly different angle, I do
9	think that that business model choice about how you
10	choose to distribute your product shouldn't really
11	affect how we think about openness for platforms,
12	because I think both in all three of those examples,
13	Microsoft, Android, and Apple, they were all open in
14	the sense that they were a platform that tried to
15	attract not just users, but also third-party apps.
16	So originally I think Apple reportedly had been
17	considering not having any third-party apps on the

18 iPhone, but, you know, as soon as -- so, like, I think

.ingefolld-p storangc (.aotheckBerry,) Tojsted 94 at form 283 70 and 2188 Black Barry, Tc (13) Tj 12 0 0 12.70.408 283.26

20 .2001/8d-m -.0pv1edpiTm aa1811

1	know, you could do a polluted JAVA, right?
2	I mean, you could be encouraging you could
3	be making representations to their app developers and
4	then changing the terms and creating lock-in.
5	There's so I would encourage the Commission not to
6	be distinguishing different business models where
7	really kind of the platform nature was people were
8	calling it was it platforminess, is that what they
9	were calling it that the ODM/OEM part of it is
10	really not kind of fundamental to the antitrust
11	analysis.
12	MS. BLANK: Okay. On Hal's proposal of

13

**140** 10/17/2018

- 1 of the K-cup so that generic K-cups don't work with it
- 2 anymore. A great question from the audience is, should
- 3 supermarkets not be able to put their private-label
- 4 products on the top shelves? And why should we only
- 5 have a nondiscrimination rule for the internet, if
- 6 that's what you were suggesting?
- 7 Lots of questions for you, Hal.
- 8 MR. SINGER: Yeah, I get -- I appreciate it,
- 9 and I get that one a lot about am I going to -- is this
- 10 regime going to restrict what Safeway can do on its
- 11 8

operators' app; number two, that you were you
received disparate treatment and you did so because of
your lack of affiliation, as opposed to some other
efficiency justification, and this is the causation
prong that allows the cable operator to provide
efficiency defenses. And then third, as a result of
one and two, you were materially impaired in your
ability to compare effectively or unreasonably
restrained.
It's that prong that I believe has prevented
anyone from using the nondiscrimination protections to
file a suit against, say, a mom and pop cable operator,
and the reason is, is that if you were to do so, you
would likely fail on that third prong. And so I think
that third prong, material harm to the complainant, is
what would prevent cases being brought from anyone
except the largest and most dominant tech platforms.
I'll just leave with this one last thought. On
the Safeway notion, I looked at market shares in
brick-and-mortar groceries, and Safeway just doesn't
have the requisite share in that market to ever
engender the kind of foreclosure levels that would make
life miserable for an independent who couldn't get on
Safeway's shelves.

25 In contrast, when you look at the e-commerce

1 market, you see that Amazon has a significant share and 2 likely would have sufficient size to foreclose an 3 online merchant, and so in that sense, you know, I 4 can't predict how the cases will shake out, you know, 5 how a judge would rule as to whether or not that 6 material injury prong was satisfied, but I can tell you 7 that Amazon would be much a more likely respondent than 8 Safeway if these rules were to come into existence. 9 MS. BLANK: Does anyone else want to comment on 10 the application? 11 Please, Nicolas. 12 MR. PETIT: Yes. So Hal's dream is probably --13 you can probably find, you know, a sort of a 14 substantiation of your dream in Europe. It is known 15 that Americans wrote European Union competition law. 16 You know, Robert Bowie, a Professor at Harvard, I 17 think, and George Bull, in Brussels, were the drafters 18 of the treaty provisions that we have on 19 discrimination, and so we have now a provision in the 20 treaty, which is in the chapter on competition, which 21 says that it's unlawful for a dominant company to treat 22 similarly situated trading parties differently, thereby 23 inflicting on them a competitive disadvantage, right? 24 So we have that, and so the question is, what 25 have we done with that American creation in Europe?

1

12

13

14

15

16

17

18

19

20

21

And the answer is, well, we have not really applied it because it's very complicated on the facts. So the notion of competitive disadvantage lies in the eye of the beholder. You know, level playing fields, all those things are extremely, you know, difficult to gauge on the facts. And I think the third prong of your test would not only make fail complaints against mom and pop cable providers but also against large companies, because it's very difficult to substantiate such claims. So what we know from our experience in Europe is that when the European Commission has received complaints of unlawful competitive disadvantage in abuse of dominance cases, instead of treating them under that legal basis, they sort of move the case to another theory of liability, like leveraging or equality of opportunity, as I mentioned before, and sort of skirted the discussion on discrimination. because it's just very complicated. MS. BLANK: Although if I can follow up and ask you again about Google Shopping, some would argue that

- 22 Google Shopping really is about a dominant platform not
- 23 being able to pick winners and losers, the remedy at
- 24 least that was suggested. What is your view on that?
- 25 MR. PETIT: So I agree that the outcome looks

1	really like sort of, you know, nondiscrimination
2	outcome. The reasoning that went into the case was
3	very, very abstract and very formal. You know, the
4	Commission was simply talking of equality of
5	opportunity, thereby sort of implying that everyone
6	should have an opportunity to be on the platform, you
7	know, regardless of what Google did on the facts.
8	So the reasoning of the European Commission is
9	not predicated on the legal basis that belongs to
10	nondiscrimination. I don't think the concepts of
11	discrimination appear literally in the decision. The
12	European Commission talked of equality of opportunity,
13	and that basis only was material in reaching that
14	outcome.
15	MS. CREIGHTON: Yes, just to oh, I'm sorry.
16	MS. BLANK: No, both of you, please.
17	MR. LEE: No, sure. I wanted to just bring up
18	a point that's related but I don't think has been
19	brought up quite yet, and that's in regards to
20	regulation that might, let's say, tilt bargaining
21	leverage away from platforms towards a product market
22	where the participants have market power. And I'm not
23	quite sure if Hal's proposal would fall into this
24	bucket, the details do matter, but what I mean is the
25	possibility that, using an analogy from healthcare

1	settings, if you think of insurance providers as a
2	platform by which consumers join them to access medical
3	providers, you know, I have a paper with a coauthor
4	that examines, let's say, minimum network standards or
5	must carry provisions.
6	In that setting, we find that actually those
7	provisions, although motivated by access and making
8	sure people can get to doctors and hospitals that are
9	close to them, can result in higher negotiated input
10	prices and potentially higher premiums, thereby harming
11	consumer welfare. And this happens because insurers
12	are able to play off substitutable providers against
13	one another, and these substitutable providers actually
14	have local market power, and, you know, healthcare is
15	fairly concentrated in most local markets.
16	So pulling back now to the tech space, it could
17	be the case that Amazon in certain product markets is
18	really negotiating with manufacturers, and those
19	manufacturers are concentrated in whatever products
20	that they're offering. And so one just wants to bear
21	in mind that there are other potential consequences
22	that can happen when we impose these kinds of
23	restraints on what platforms are and are not able to
24	do.
25	This also comes through, like, cable

**147** 10/17/2018

1	experts galore, you know, sort of the practicalities of
2	this just sort of you know, I guess would be one
3	thing to sort of be kind of thinking about.
4	A second concern would be, you know, sort of
5	although I think Hal is intending to sort of focus this
6	on, you know, sort of I guess sort of smaller
7	players being able to challenge dominant firms, you
8	know, that's all kind of in the eye of the beholder,
9	very heavily dependent on market definition, who's
10	dominant, who's not. That seems to be an area that I
11	would say is chronically underexamined in terms of how
12	do we define products in this space, partly because of
13	the integration problem, the dynamism and stuff.
14	But just the likelihood of dominance, of, in
15	fact, firms with market power being able to game the
16	system seems to me extremely high, just to I guess
17	back when I was representing Netscape, you know, they
18	had 70 percent browser share. I remember somebody at
19	an agency joking, you know, why aren't we investigating
20	you? You know, so it's not all that hard to imagine
21	Microsoft, you know, kind of bringing this kind of
22	challenge against Netscape for being dominant in
23	browsers and slowing it down.
24	You know, and then just the final concern, and
25	kind of related to that second one, is I think one of

1	Hal's examples in one of his papers is sort of the
2	preferencing that Amazon has in their home assistant
3	for Avis. You know, that would be a great example of a
4	market where, you know, it's just barely getting going,
5	got five or six firms all tumbling into this market all
6	at one time, and sort of if you think about sort of
7	untying you know, what is the technological
8	preferencing plus gamesmanship plus innovation in the
9	market, which is you know, it's very hard to imagine
10	kind of there's a reason you end up going slow in
11	antitrust matters, and sort of the potential for
12	gamesmanship and for getting it wrong is pretty high.
13	MS. BLANK: Hal?
14	MR. SINGER: Yeah, let me just respond really
15	quickly to Susan's three points.
16	On the question of practicality of implementing
17	a nondiscrimination regime, we don't have to look to
18	Europe. We can look to the United States and the cable
19	experience. We have a handful of cases that you can go
20	look into and see how they were adjudicated, how they
21	were resolved. NFL Network vs. Comcast, MASN vs.
22	Comcast, Tennis Channel vs. Comcast and I have to
23	disclose, I was the complainant's expert in each of
24	those, and I am no longer invited to the Comcast
25	Chanukah parties but, you know, we just need an ALJ

1	On that note, another question from the
2	audience. You're very popular.
3	Is your idea, this nondiscrimination standard,
4	predicated on the FTC's failure to bring a case against
5	Google in 2013? And would your plan have addressed
6	that failure?
7	MR. SINGER: That's a great question, but I
8	don't think it's predicated. I would still be arguing
9	that there are gaps in enforcement under the antitrust
10	laws and under the consumer welfare standard,
11	regardless of what the agency did in that case.
12	And I just want to point out, too, that if this
13	regime were to exist on the sidelines, it would in no
14	way immunize the tech platforms from antitrust cases.
15	I mean, take Comcast. There have been famous antitrust
16	cases bought against Comcast in light during the
17	period of the nondiscrimination regime. You probably
18	heard of a case that went up to the Supreme Court
19	called Behrend vs. Comcast, which was an antitrust case
20	concerning clustering. And so I don't think that it
21	would in any way foreclose an agency from bringing a
22	standard case.
23	What I said in the speech, and I'll just remind
24	folks, that, again, if it I don't want to send

25 someone into a landscape that I expect them to lose. I

- 1 don't think anyone would want to do that for whoever
- 2 they're advising, but -- and this is an important
- 3 but -- if you can find a case where the harm presents
- 4 itself as a price, output, or quality effect, then by
- 5 all means the FTC should bring that case.
- 6 And I'll point you to a paper by Michael Luca
- 7 at Harvard and Tim Wu, Columbia Law, who have shown
- 8 that there could be a product quality case brought
- 9 against Google with respect to allegedly degrading its
- 10 search results in order to favor its own content. Now,
- 11 that was on -- granted, that was on a very limited
- 12 search term, and I think that you would probably need a
- 13 greater sample on a bigger database in order to bring a

- 1 here quietly, to address that.
- 2 MS. CHIOU: Sure. So Nicolas mentioned earlier
- 3 that the growth strategy of firms can also include
- 4 adding verticals, so I would say, just based upon
- 5 economic theory, that there are incentives for
- 6 platforms to innovate and to provide sometimes a free
- 7 experience for one side of the market, outside of
- 8 integrating its own product or having any sort of
- 9 preference for its products.
- 10 So this is really just part of being a
- 11 platform. It's really in their best interests to
- 12 maximize the number of transactions that occur to make
- 13 sure that as many are occurring on their platform as
- 14 possible, and so a lot of times that means offering,
- 15 you know, the platform free to one side of the market
- 16 to have a critical mass of consumers or sellers in
- 17 order to attract the other side. This could also mean,
- 18 you know, innovating to enhance the user experience on
- 19 the platform, really just anything to create more
- 20 transactions on the platform.
- 21 MS. BLANK: Does anyone else have any comments
- 22 on that?
- 23 MR. PETIT: Yeah, I just want to say that, you
- 24 know, there is like a fair amount of literature which
- explains that when firms have imperfectly appro dye-.rik9r3tro8 260.1.rik91y n5.2 373.5

1	assets, it makes sense to add verticals or, you know,
2	try to extend the scope of the firm in order to recoup
3	investments, you know, and fixed costs and other
4	things. And so I think that literature I mean, no
5	one has sort of shown me that that literature should
6	not apply to platform markets or anyone say that
7	there's sort of standard theory basis about, you know,
8	the digital world as a world in which you don't have
9	much appropriability in terms of, you know, IP rights
10	and others, which would entitle you to sort of not go
11	through scope or verticality to recuperate those
12	investments.
13	MS. BLANK: You know, Nicolas, one of the
14	comments you made earlier that I wanted to get back
15	to and this reminded me of it is I think in your
16	prepared remarks, you suggested this idea that we
17	should consider whether a platform can add verticals,
18	can vertically integrate depending on the size I
19	think the size, nature of the platform, and I apologize
20	if I'm misparaphrasing what you said.
21	I'm wondering if that concept takes into
22	consideration the kind of vertical that a platform
23	would be considering, this customer acquisition
24	vehicle, and whether it also requires the antitrust
25	agencies to make guesses as to whether any particular

1	vertical integration will actually add to the dominance
2	of that upstream platform.
3	MR. PETIT: Um-hum, okay. Well, that's a tough
4	question. The questions are tougher in America than in
5	Europe. That was very kind for me to say that.
6	Now, I so one way to try to address your
7	question and one sort of puzzle that I think a lot of
8	observers have when they look at enforcement against
9	platforms in verticals is why Google Shopping but not
10	Google Flights? And why Google Flights and not Google
11	Music? And why not YouTube?
12	And when agencies apply antitrust in a
13	particular case, those cases are often minimized in
14	terms of their impact by the defendants, which says
15	this finding is for the particular case, and
16	exemplified by complainants trying to sort of explain
17	that those findings should apply across the board to
18	other verticals of the platform.
19	And I think one of the ambiguities of antitrust
20	enforcement is that you have those findings of
21	liability in a particular market, regarding a
22	particular infringement, and a particular company, and
23	there is very little we can infer in terms of the
24	general deterrence effects and/or the general
25	implications of the findings.

## 1 Maybe, you know, you could think regulation 2 should be there because at least with regulation you 3 get a clear sense that the rules apply across the 4 board. You could, you know, think this way, or another 5 possibility is to try to promote rulemaking by 6 administrative agencies so they can explain that the 7 findings made in particular cases should, you know, 8 extend to certain markets, not others, or all markets. 9 I mean, that's sort of the thinking I have on that. 10 MS. BLANK: Thank you, I appreciate it, and I 11 apologize for catching you off guard. 12 MR. PETIT: No problem. 13 MS. BLANK: So I want to turn to -- with our 14 last ten minutes, I just want to make sure we hit on 15 this topic. It's been the hottest topic in antitrust 16 discussion for the last year or more. Of course, the 17 commonality of all of these platforms -- Google, 18 Amazon, Apple, Facebook -- is that they collect data. 19 They collect lots and lots and lots of our data. 20 For example, look at Google, which appears to 21 have real clout across every point of the display 22 advertising chain, online display, you look at the buy 23 side, the sell side, the ad exchange itself, and Google 24 is right there at every point. That is a lot of data

about each critical point along the advertising

- 1 continuum.
- 2 Does data, in and of itself, provide a
- 3 competitive advantage to a platform like Google or
- 4 Amazon or Facebook?
- 5 Maybe we can start with Robin on that question.
- 6 MR. LEE: Sure. You know, I do think that
- 7 there's a sense in which data, say about consumer
- 8 demographics or product preferences, can be seen as
- 9 essentially a cost-reducing or perhaps quality-
- 10 improving technology, much like know-how or experience
- 11 that's sort of gained through the production process.
- 12 Absent that, you need independent investment to gather
- 13

1	MS. BLANK: Oh, please, Lesley.
2	MS. CHIOU: Yeah. So, actually, I just want to
3	talk a little bit more about what Robin mentioned about
4	a potential quality advantage. So this is something
5	that my co-author, Catherine Tucker, and I looked at.
6	So we wanted to know whether or not search engines, if
7	they could retain longer periods of user logs, search
8	logs, whether or not this would lead to better quality
9	searches for users. So this is a working paper. It's
10	not published because we didn't find sort of any
11	empirical result.
12	So what we did was we looked at, you know,
13	differences in data retention policies, and we found
14	that, you know, whether or not they were lengthened or
15	shortened, that it didn't quite affect we didn't
16	find any effect really on the quality of search that
17	was being delivered to users and consumers.
18	And so there could be, you know, a few reasons
19	for this. It could be that, you know, having very,
20	very old data doesn't do such a great job of
21	predicting, you know, new information. I know that for
22	Google, at least, you know, 20 percent of searches that
23	happen in a given day are search queries that they
24	haven't seen in the past 90 days.
25	I do think, you know, that this is probably an

1	area that we need, you know, more empirical research
2	on. There could be other ways of measuring search
3	quality, something more indirect than what we do, and,
4	of course, there could be benefits to consumers for
5	search engines having longer periods of data, maybe
6	through, you know, algorithm testing or through fraud
7	prevention.
8	MS. BLANK: Anyone else?
9	MS. CREIGHTON: Yes. So maybe actually just to
10	pick up on a note of what Lesley was talking about and
11	then maybe kind of more broadly on data, so one of the
12	interesting things maybe it was in a paper you
13	co-authored, Lesley, and I know Catherine may have
14	talked about it two days ago but the importance of
15	localization. Many people are kind of looking at
16	competitive at sort of scale benefits that you
17	know, I think she gave the example of I don't really
18	care who has the restaurant reviews in Boston, you
19	know, sort of or I what I care about is that
20	they're in Boston she's at MIT and I don't really
21	care if they are in Seattle.
22	So I think you can kind of take that idea and
23	apply it sort to productize it, sort of like I don't
24	really care you know, if I'm in travel search, I
25	don't really care how comprehensive your hotel listings

1	are if what I'm looking for is, you know, sort of, you
2	know, music search or something, and so an interesting
3	thing will be kind of what data are we talking about
4	that way, and I think some of the it will be
5	interesting kind of how that research leads going
6	forward.
7	But stepping back, you know, sort of I did
8	speak on I guess an ABA panel in the spring on the
9	whole big data issue, so I have been giving it some
10	thought, and it will be interesting to see kind of
11	empirically where this goes. Right now, you can color
12	me skeptical, that, you know, it seems it's sort of
13	serving right now as a stand-in for you know, by
14	comparison with tangible physical assets, you know,
15	like think AT&T's local networks, the cable companies,
16	the last mile, you know, those are you know, it's
17	

17

1	localized to physical, tangible hardware, so but if
2	we're talking about big data kind of then abstracted
3	away into some purely virtual environment, you know, I
4	just haven't really seen examples of that being borne
5	out, like in the mergers that the FTC has been looking
6	at or something.
7	You know, in fact, if you I would have
8	argued maybe what I've seen more is that the
9	barriers that data used to be more of a barrier to
10	entry with you know, so like I was involved 20 years
11	ago when West and Thompson were merging, and there was
12	a question about, in legal research, whether or not the
13	internet could be a constraint on legal online
14	searching, and the you know, sort of in fact,
15	yes, sort of the DOJ concluded it could for current
16	cases, but the problem was that there were all these
17	states that had, you know, sort of like basically no
18	records of their past cases.
19	So that was a legacy data problem, and that
20	actually seems to be coming up a lot in a lot of the
21	FTC's recent cases, you know, so like the concern
22	about I think in Verisk-EagleView. There was sort
23	of the concern about archival footage involving
24	roofing. Nielsen-Arbitron involved kind of the value
25	of the historic radio and TV panels. So clearly data

1	can be a barrier. I guess the question is, is that
2	barrier going up or down as we're moving to a more
3	virtual world?
4	One of the it was interesting to me because
5	our firm was involved in this, sort of the one big data
6	examples that Gal and Rubinfeld pointed out was in the
7	BazaarVoice-PowerReviews merger, and said that was sort
8	of the that was their example of the merger that
9	best reflected concerns about big data. You know,
10	respectfully, you know, sort of ratings and reviews are
11	actually kind of the antithesis of big data.
12	I mean, they are actually held up as typically
13	you don't need big data, which is really more about
14	extrapolating odd correlations when you're looking at
15	massive data, because you have just got one review, and
16	what I really care about is this guy said this
17	restaurant's good.
18	So it's actually an example of a non-big data
19	kind of data sat, and PowerReviews itself had only 11
20	million in sales at the time it was acquired, so it
21	doesn't exactly conjure up visions of some massive
22	amount of data. So I think it remains to be seen kind
23	of whether or not big data is going to turn out to be a
24	problem.
25	Just two other thoughts with respect to whether

25 Just two other thoughts with respect to whether

1 or not it is a lot of sort of the dropping -- the 2 plummeting cost of data collection, analysis, and 3 storage, is it actually going to facilitate 4 competition? So we were also involved, our firm was, 5 in the Zillow-Trulia case, and I think it's been 6 estimated that something like 99 percent of all data 7 currently is unused. Those were companies who figured 8 out how to take public domain databases about real 9 estate sales and try to create a database that could be 10 at least a partial substitute to what has been a 11 legacy, huge, historical advantage of the multilisting 12 database. 13 And so one of the things -- this will be 14 interesting as time goes on -- is to see how much are 15 we seeing companies innovate in taking public domain 16 and other data sources that are just lying around 17 unused and actually causing increased competition, not 18 decreased. 19 And then I guess finally it's a sort of -- and 20 kind of relatedly -- you know, so the question about if 21 there's a lot of different ways to sort of use 22 different data sets to get to the same problem, how 23 likely is it going to be that a company actually 24 engages or tries to engage in foreclosure strategies? 25 The EC had a very interesting analysis at the

**165** 10/17/2018

1

- 1 innovation on the edges, and it certainly provides an 2 impetus or a push towards an intervention of some sort, 3 and the question is of what sort. 4 There is a constituency forming around this 5 notion of data portability, and if I could just 6 quickly, you know, weigh in on that one, you know --7 and I know that -- I don't mean to hurt their feelings, 8 because I need support for the Net Tribunal, so maybe 9 we can trade each other's support. 10 But, you know, they like to invoke the 11 experience of number portability, and I was a big 12 fan -- I have a piece on estimated consumer welfare 13 benefits of number portability -- but I think the 14 prospects of success here are different and less, 15 unfortunately, because in the cell phone space, you 16 didn't need to coordinate with all your friends to make 17 a move; you just got permission to take your number 18 with you, and you went to a rival carrier. 19 And here I think that there's a very complex 20 coordination problem of everyone in your network kind 21 of moving at the same time to the new platform, and I 22 think for that reason, among others, I'm not as 23 enthusiastic about calling for mandatory data 24 portability.
- 25 MS. BLANK: Thank you so much, and I have 20

1	more questions I could ask on data. This is a great
2	topic, but unfortunately, we are out of time, and I
3	just want to give a huge thank-you to this amazing
4	panel we have had this morning. There are going to be
5	more data discussions, I think, coming up at these
6	hearings in a few weeks. So thank you so much,
7	everyone.
8	(Applause.)
9	(End of Panel Number 2.)

1	PANEL 3: NASCENT COMPETITION: IS THE
2	CURRENT ANALYTICAL FRAMEWORK SUFFICIENT?
3	MR. SAYYED: Okay, I think we'll get started.
4	We have three panels and two presentations on nascent
5	competition this afternoon to illustrate the importance
6	that the Chairman specifically and the Commission
7	collectively is putting on this issue.
8	First, we're going to hear from Susan Athey,
9	who was on an earlier panel this morning, and as those
10	of you who were here or were watching earlier, she's
11	Economics of Technology Professor at Stanford's
12	Graduate School of Business. She will do a
13	presentation which will talk a little bit about the
14	incentives business model of the tech firms.
15	Then we will turn it over to Paul Denis to do a
16	presentation really describing the current analytical
17	framework for analyzing acquisitions of nascent
18	competitors or, arguably, acquisitions occurring in
19	nascent markets.
20	Once they're both done, we'll have a panel
21	discussion, and I will introduce the panel when we turn
22	to the panel discussion.
23	As I think everyone knows, if you have
24	questions, you either have a card already or you can
25	signal for a card from some of the FTC staff that's

1 circulating amongst the room, and it will be passed up 2 to us for possible or even likely inclusion in our 3 discussion. 4 So with that, I will turn it over to Susan, who 5 will then turn it over to Paul. 6 MS. ATHEY: Thanks so much for having me here 7 today, and what I would like to do in my remarks is to 8 really connect some of the issues from the morning and 9 the afternoon and talk about some of the reasons that I 10 think they are connected. 11 One of the main reasons I was concerned about 12 vertical manipulation and sort of vertical integration 13 is that, in fact, that is a nascent competition issue 14 for certain types of platforms. And another theme that 15 I want to continue from the morning is that in order to 16 understand what the role of regulation should be and to 17 understand the welfare consequences of behavior, it's 18 important to first understand the strategies of the 19 firms, because firms are most likely to do something 20 that's a bit of an antitrust risk, as well as 21 potentially harmful for consumer welfare, if they're 22 facing certain kinds of threats. And so understanding 23 what firms would view as really existential threats is 24 sort of a critical input to knowing where we should be

concerned or at least to understand what's going on.

So I want to start out just by thinking about
how I would talk about this to my business school
·
classes, because that's really, I think, where you
start thinking about business strategy and business
incentives. And so when I teach about platforms to my
business school classes, I start by posing some
questions they want to think about.
Are these platforms going to tend towards
monopoly? When would you see competition? When are
they going to be profitable? And what I'll really want
to focus on today is, is it possible for a new startup
or a new company to enter and succeed against
established incumbents? And, if so, how would you do
that?
And if you understand how you would do that, of
course, that also flips back to if you were the
incumbent I always, as an economist, like to take
the side of the entrant when teaching my classes
but, of course, the flip side of the advice for what
the entrant should do is what the incumbent should
block, and understanding those strategies can help
guide policy.
So, you know, we talk a lot about basic
platform economics, and the key point there, of course,
is the chicken and egg problem. If an entrant's going

1	to come in and get started, they need to solve that,
2	more buyers, more sellers, more sellers, more buyers,
3	and also the broader types of economies of scale that
4	are incredibly important in tech companies. It's not
5	just, you know, having more data, which is important,
6	but one thing I really like to focus on is learning by
7	doing, the fact that if you're one of the benefits
8	of being an incumbent is that you have lots of users,
9	you can experiment and learn from the users what works
10	and use the data, but not just have the historical data
11	of any type, but historical experiments that have
12	allowed you to understand how to make your product
13	better.
14	When I think about you know, I ask questions
15	about market structure and profitability. How do you

16 get started? How do you scale and grow? And, of

1	to from before, you know, the modern tech era, although
2	this was also in a way a tech case. And this is the
3	case of American Airlines and Sabre, and here's a
4	newspaper article from 1982, and it's talking about a
5	Justice Department investigation to see if computerized
6	scheduling and reservation services might have been
7	manipulated to give an advantage to American.
8	Here's some quotes in that same article from
9	the American CEO. He starts out by saying, "Well, the
10	best guarantee that the Sabre system doesn't advantage
11	American Airlines is that we have to sell them to
12	travel agents. So travel agents buy them. That
13	disciplines us to be fair."
14	But then he goes on immediately to say, "Well,
15	we're mostly fair, but actually, we advantage American
16	Airlines." So the fact that travel agents choose
17	systems puts some discipline on the system, but not
18	enough to keep them from advantaging American.
19	And, you know, as and then and then a
20	final point that he makes is, "Well, we invested in the
21	Sabre system, we built it, so, therefore, we should be
22	allowed to use it to advantage our own airline."
23	And, of course, anybody who's been following,
24	say, the Google antitrust case will recognize all of
25	these as the same arguments that Google used to talk

1 about with their vertical manipulation. 2 So when we think about these cases -- and as an 3 economist, in some ways I think this case feels a 4 little easier because we feel like we have, like, an 5 allergic reaction to somebody not showing customers 6 prices, like that feels immediate and harmful, and we 7 can immediately map that into the impact on prices. 8 But, in fact, you know, when I think about this 9 case, really the thing that bothers me more about it is 10 the fact that it made it hard for low-cost carriers to 11 come in. So if you know more about the history of this 12 case -- I won't go through all the details today -- but 13 not only did this manipulation soften price competition 14 and mislead consumers, but it also, it was alleged, led 15 to the exit of low-cost airlines because those low-cost 16 airlines weren't able to compete on price and get the 17 traffic away from American. 18 And, of course, we know that a low-cost airline 19 can enter in some routes, gain scale, and then grow 20 into a larger competitor, and so that using your 21 platform to keep someone from getting a toehold and 22 eventually reducing competition is really what concerns 23 me. 24 So if I put that in context -- and, of course,

as we talked about this morning, there are lots of

1	things platforms do in the vertical space that are
2	actually good for consumers and in the interest of
3	consumers. So, you know, Walmart ensures suppliers are
4	competitive. Airbnb makes sure that hosts that respond
5	quickly and provide high quality are ranked more
6	highly. Even search engines demote irrelevant ads and
7	don't show them. All of these are things that maybe
8	the advertisers or the suppliers don't like but are to
9	the benefit of consumers, and so those are types of
10	vertical behavior that I might not worry as much about.
11	So the kinds of things that I'm going to be
12	more concerned about are things that might be really
13	threats to a dominant platform, and so when I started
14	thinking about this, one question I started looking at
15	more than ten years ago was, you know, how can a search
16	engine compete, a general horizontal search engine
17	compete? And so one way that a smaller search engine
18	can compete is to get really good in a narrow category.
19	And, of course, the chicken and egg problem of a
20	platform more users, more advertisers, more
21	advertisers, more users can actually be solved
22	within a vertical. And so one way you can compete is
23	to get really good at something.
24	So I was advising Microsoft that they they
25	made an they went out and found the very best travel

1	search provider, ITA at the time, integrated that into
2	the back end of Bing, and had better travel services
3	than Google did, which then was allowing them to steal
4	share away from Google in the travel vertical, and the
5	hope was that, from Microsoft's perspective, that that
6	would then allow them to grow and get the consumers to
7	do adjacent verticals.
8	Now, what happened was Google bought the ITA
9	travel search engine, which ended the Bing
10	relationship, and flipped it to where Google was better
11	in travel than Bing was. And so this is interesting
12	because, you know, first of all, the travel search
13	itself, it could have spawned into something completely
14	distinct and not integrated with either platform, but
15	it also was something that helped a very small Bing
16	was around 7 or 8 percent market share at the time, it
17	wasn't called Bing it could have helped it grow into
18	a larger general competitor.
19	And broadly, if you were going to compete with
20	Amazon or compete with Google or compete with eBay in
21	what they do, you know, it would be silly to come in
22	and try to think that you could be better at everything
23	all at once. Instead, generally, you might start in a
24	vertical. And so they recognize those threats and try
25	to make sure that in a vertical, nobody gets too big or

1	Europe, and then from there, they might have grown into
2	a competitive ad platform? You know, maybe that would
3	have happened, and now we see that it did happen.
4	When we were talking about it, we didn't know
5	whether Amazon would be successful in advertising, and
6	we still don't know how big it will be. And so as an
7	economic expert, to talk about these longer run impacts
8	I think is really challenging, even though the welfare
9	effects from that are just so much larger than the
10	short-term effects.
11	Another way that you can enter is to find and
12	get a lot of traffic from intermediaries, and so,
13	again, in search, that was another way that we wanted
14	to get from an unprofitable and never possibly
15	profitable, at 7 percent market share, to something
16	bigger. So you look out and you say, who else has a
17	lot of consumers and maybe I could get those consumers
18	as a block to switch platforms? And, of course, in
19	turn, that's a threat to the incumbent platform.
20	So just as an example, if Google had not had
21	

1

2 things. 3 First of all, that intermediary that can shift 4 a whole bunch of consumers in a block, risk one is they 5 might shift those to a competitor, and risk two is they 6 are just going to extract all the surplus. So Google 7 has to pay billions of dollars a year to Apple in order 8 to make sure that Google is the search default, and 9 this also can happen with browsers. A very popular 10 browser can put up to auction what's the default search 11 engine and extract a lot of the surplus, and so on. 12 And then once we understand that, the big risk 13 to firms is any other intermediary who could shift big 14 blocks, take their partners with them to another 15 platform, we can think about the incentives that the 16 platform has to make that not happen. And there's lots 17 of examples of these different -- we call them 18 referring services -- they may not be able to exactly 19 bring their customers with them, but they can shift 20 customers from one platform to the other, and they 21 typically have a lot of power and are also potentially 22 very ripe for vertical integration that may or may not 23 be beneficial. 24 Now, another big theme that's important is that

traffic all at the same time, and so that means two

25 when we think about all the things that a company can

1	do to try to in the face of a potential threat, what we
2	would like a company to do when they're faced with a
3	threat from a new entrant is to make a better service
4	or you know, and if it's a vertical competitor, they
5	might say, ah, if I'm worried that shopping is going to
6	be really big, I am going to make my own shopping, and
7	it's going to be really awesome, and even if I don't
8	manipulate, everybody's going to use my awesome
9	shopping service. That's one, like, welfare-enhancing
10	thing you might do.
11	Another welfare-enhancing thing you might do is
12	just make your search engine or your platform even
13	better, so that even if that shopping engine gets big,
14	people still want to use your main central platform.
15	But there's also things that you might do that are
16	welfare-harming, like make or buy an adequate vertical
17	service and then promote it and advantage it to take
18	away customers from the competing vertical service,
19	make sure that you own that thing, so that you've now
20Tc (12)Tj 12 0 0 12 1533 hi260.7001 Tm0001horizo adrtical competform.	

1 effects. So, you know, things like ad-driven news 2 media or review websites -- these are all examples of 3 things that can really harm and, therefore, never get 4 the chance to grow into something that might become a 5 more horizontal competitor. 6 Now, this type of thing also happens in other 7 types of contexts as well. So we haven't talked a lot 8 about ad tech today, and it's actually kind of hard to 9 talk about because there's so much jargon and it's 10 really complicated, but just as an example, we can 11 think about what's a way that someone might enter and 12 compete in ad exchanges? 13 Well, if you have two advertising exchanges, 14 where publishers and advertisers buy and sell ads, what 15 a smaller ad exchange might hope is that they can get 16 advertisers and publishers to multihome, and that might 17 give them a chance to grow into a larger ad exchange 18 and a more effective competitor. 19 And when you think from the publisher's side of 20 this market, it's actually like, in principle, pretty 21 tough competition, because the ad exchanges are giving 22 the publishers money. So that's, like, perfect 23 substitutes -- it's just which ad exchange is going to 24 give me more money.

25 So if there's two equally sized ad exchanges,

1	all the revenue should go to the publishers, because,
2	you know, I am going to one exchange says I'll give
3	you this many cents per impression, and then the other
4	publisher says I'll give you a little bit more, and
5	they would cut out their take rate and have to give all
6	the surplus to the publishers, or else the publishers
7	would just go to the other ad exchange.
8	So it's really scary, if you're a big ad
9	exchange, to worry about a smaller ad exchange growing,
10	because if they get to the if they're equally sized,
11	this is kind of a zero profit business basically. You
12	have to give all the revenue to the publishers.
13	Is that my time? Yep. So let me finish my
14	thought here.
15	So in order to prevent that type of growth, you
16	can use something like a tool, a software tool, that
17	helps people compare across ad exchanges, and if it's
18	vertically integrated, those tools can actually
19	advantage one ad exchange over the other. And so in
20	particular this particular practice was ended in
21	2017 the software would basically collect the bids
22	from all the other ad exchanges and then give Google a
23	chance to come in at the end and outbid the others just
24	by a penny and get the traffic, which prevented the
25	smaller nascent competitor from growing.

- 1 So the big theme is that in these types of
- 2 markets, we have to look at what are the tactics that
- 3

For The Record, Inc. (301) 870-8025 - www.ftrinc.net - (800) 921-5555

- 1 large, complicated merger transactions.
- 2 MR. DENIS: Thank you, Bilal. Thank you for
- 3 the opportunity to be part of this conference. A tough
- 4 act to follow, Susan. A fascinating presentation.
- 5 Mine will be much more prosaic, focusing on the legal
- 6 framework, but Susan has set it up well in giving you
- 7

- 1 write some papers, maybe he needs a research assistant,
- 2 I should go see him about a job.

3 So I went to see him, and I didn't know much 4 about Joe Bradley at the time, but if I had done even a 5 modicum of research. I would have learned that he had 6 written the seminal article on what was called The 7 Potential Competition Doctrine. It was an 89-page, 300 8 some-odd footnote tome in the Yale Law Journal, with 9 the cumbersome title of Potential Competition Mergers: 10 A Structural Synthesis. It was a mouthful. 11 But as fate would have it, he was working on 12 another article. He had been asked to contribute to a 13 California Law Symposium on mergers under the then 14 brand new 1982 Merger Guidelines, and his topic was, 15 not surprisingly, potential competition mergers. I'm 16 not sure that he really needed a research assistant to 17 help him with that, but he hired me. What was supposed 18 to be a job turned into a paid tutorial for which I was 19 the principal beneficiary. 20 With my short-term cash flow problem in check, 21 I started thinking maybe I need another job next 22 summer, so I, you know, proudly put on my résumé that I 23 was the research assistant for the distinguished 24 professor Joe Bradley, working on this important 25 article on potential competition mergers, and I signed

1	up for a bunch of interviews with law firms that were
2	doing what I thought was important antitrust work.
3	One of the firms I targeted, Skadden, sent two
4	interviewers to campus, and one was a tax lawyer and
5	one was an antitrust lawyer. Somehow, by luck or
6	design, I ended up on the list with the antitrust guy.
7	It turned out that was Bill Pelster, who had just tried
8	the Grand Union case, one of the FTC's most important
9	potential competition decisions.
10	By the time I interviewed with Bill, I knew a
11	little bit about the potential competition doctrine,
12	not a great deal. It was a good thing I did, because
13	he spent the whole interview telling war stories about
14	the case and drilling me on various aspects of the
15	doctrine. So Joe Bradley saved me there. Bill never
16	really interviewed me, but he managed to get me a job
17	anyways, so
18	I had the benefit of working with Bill and a
19	number of other extraordinary colleagues, including a
20	guy who was just about my age, who I think all of you
21	know, who is Joe Simons, now our FTC chairman, a great
$\mathbf{r}$	

- 1 could honor some people who I think were important in
- 2 my career, but I tell you these stories because they
- 3 illustrate what I think is a central point that we need
- 4 to focus on this afternoon in these hearings.
- 5 That is, you know, these concepts of nascent
- 6 and potential competition really are pervasive in U.S.
- 7 antitrust merger law and merger enforcement practice.
- 8 It's something well embedded in our legal framework,
- 9 and the panels that are going to follow, you know, will
- 10 debate the efficacy of some of those frameworks, but I
- 11 don't think there's any debating that these concepts
- 12 are well entr1514 4. Tc (and Esa3.08 6nyeheses/7ncelell4i,12 0 vnd E062.34 576.6 Tr

1 ways that most users do not find to be intuitive at 2 all. "Nascent competition" doesn't really have a 3 formal legal definition. The word itself implies some 4 degree of competition that's present but maybe not yet 5 fully realized. In common usage, the term "nascent 6 competition" is sometimes used to refer to competition 7 that we've yet to see. I think that's incorrect and 8 concede to falling into that usage at times myself. 9 So my suggestion for this afternoon is that we 10 try to focus on "nascent competition" being limited to 11 competition that's presently being felt but not yet 12 fully realized. Used in this sense, the acquisition of 13 a nascent competitor by one of its rivals would be seen 14 as extinguishing not only current competition between 15 those firms but also either extinguishing or perhaps 16 amplifying the prospect for greater competition in the 17 future. 18 The term "potential competition," by contrast, 19 really is well defined in the law. The courts have 20 spent a considerable amount of time parsing what's 21 called the potential competition doctrine, and they 22 developed a bifurcated concept of potential 23 competition, distinguishing between "perceived 24 potential competition" on the one hand and "actual

25 potential competition" on the other hand.

1	competition doctrine, but it was dissatisfaction with
2	that potential competition doctrine that led to the
3	development of other alternatives to the traditional
4	market definition, that were thought of perhaps being
5	better ways of incorporating concepts of nascent and
6	potential competition into the analysis. We can talk
7	about how well we have done with those. Those are
8	things like "innovation markets" or "technology
9	markets" or "R&D markets."
10	Entry analysis, of course, is inherently about
11	potential competition, as is efficiency analysis, and
12	efficiency analysis doesn't even make the page here,
13	reflecting the short-shrift it usually gets in merger
14	analysis, but it most assuredly is a part of the
15	consideration of the impact of nascent potential
16	competition.
17	The treatment of efficiencies and other forms
18	of dynamic what I call dynamic response, such as
19	rapid entry or committed entry, raises a point of
20	practical application that, you know, I believe
21	warrants further discussion this afternoon. While
22	guidelines and analytical frameworks, you know,
23	generally purport to be burden-free and try to avoid
24	giving you relative weights of evidence, there has been
25	a decided drift in how we look at these issues.

1	It's been a drift in the direction of what I
2	regard as somewhat asymmetric treatment of potential
3	competition and nascent competition, and that drift was
4	reflected first in the 2006 DOJ and FTC commentary on
5	the Merger Guidelines, and later in the agency's
6	revision of the 2010 Guidelines.
7	I think the agencies are properly focused on
8	protecting nascent and potential competition. It is
9	something that warrants protection. The panel
10	discussion will explore the appropriate scope of that
11	protection, but it is certainly warranted in some
12	circumstances.
13	Where there's been a decided reluctance has
14	been in recognizing or at least fully crediting nascent
15	potential competition as market forces that can be
16	relied upon to ensure continued competitive performance
17	in markets that are affected by mergers among incumbent
18	firms, firms that are well established in the market
19	and that are not either nascent or potential
20	competitors.
21	So as the agencies sharpen their focus on
22	nascent and potential competition, my suggestion is
23	that the burdens of proof and evidentiary standards
24	that are imposed on that analysis be imposed in a

25 symmetric way, so that we're equally likely to consider

1 and recognize and credit a nascent or potential 2 competitor as a market participant as we are to look at 3 it as a market force of interest in, you know, 4 traditional horizontal merger analysis. 5 Having introduced the primary ways in which the 6 issues of nascent and potential competition analysis 7 affect our merger analysis, let me go into each of them 8 in a little bit more detail and then go into how the 9 framework might be filled out a bit. 10 So in implementing the hypothetical monopolist 11 paradigm, the agencies typically apply the SSNIP to the 12 current market price, but nascent and potential 13 competition in a market may mean that future prices are 14 going to be quite different than current market prices, and it may mean that we can reliably predict those 15 16 prices to be at a lower level. 17 The guidelines recognize this effect and 18 suggest that in those circumstances that anticipated 19 future prices be used for applying the SSNIP. So all 20 other things equal, using these lower anticipated 21 future prices will lead to a definition of more narrow 22 markets, the identification of fewer market 23 participants, and the recognition of fewer other 24 entrants. This is just one way in which nascent and 25 potential competition is slipping into the analysis

**193** 10/17/2018

- 1 know, horizontal merger analysis has subsumed a great
- 2 deal of what was previously thought of as a separate
- 3 doctrine. It's become an issue, an objective test
- 4 really, of the timing, the likelihn i ds, of the ti a sussunk0 0 11.94 122.34 599.16 Tm 076

nascent competitor is likely to be regarded as a
so-called maverick, but defining the competitive effect
of concern, as I suggested earlier, really is the
hotbed for the inclusion of nascent and potential
competition issues into our analysis, and this is felt
in horizontal merger analysis, in potential competition
analysis, you know, and in vertical analysis.
In horizontal analysis, most often we talk
about price effects. The Guidelines go beyond price
effects because nascent and potential competitors may
affect product quality, may affect product variety, and
may affect the level of innovation in the relevant
market. I've grouped all these together as output
effects because output really is the best way of
measuring what's going on, particularly when you have
price and quantity moving simultaneously.
The Guidelines have also, you know, explicitly
focused on innovation effects as a competitive effect
of concern. These innovation effects are increasingly
the focus of the agencies in practice. What innovation
effects are of concern? There's a concern about the
reduced incentive to continue innovations that may be
started by the acquired firm, the reduced incentive to
initiate development of new products, but there's also,
you know, potentially an increased incentive and

**196** 10/17/2018

- 1 ability to innovate that might derive from the
- 2 combination of complementary capabilities between the
- 3 incumbent firm and the nascent or potential entrant.
- 4 The Guidelines recognize this as well and take it into
- 5 account in an efficiencies analysis.
- 6 Here again, this asymmetry issue that I
- 7 mentioned earlier comes into play, with agency practice
- 8 seeming to reflect an expectation that reduced
- 9 innovation incentives are the more likely outcome
- 10 resulting from mergers, rather than an increase in
- 11

## 1 courts and the Commission have imposed significant but 2 appropriate evidentiary requirements on making out a 3 case under the potential competition doctrine. I think 4 that those requirements reflect, you know, considerable 5 uncertainty we all have over how reliably we can look 6 forward and predict what's going to happen in the 7 future. 8 While the Supreme Court's accepted the notion 9 that perceived potential competition states a claim 10 under Section 7, they've twice reserved on this issue 11 when thinking about the actual potential competition 12 doctrine. I think that's simply the inherent 13 conservatism of the Court, addressing only issues they 14 absolutely have to address, and not dealing with other 15 issues that they can duck. 16 Section 7, after all, is focused on whether the 17 acquisition is likely substantially to lessen 18 competition, but left unstated in the statute is 19 lessened competition relative to what? In practice, we 20 have all filled in the answer there, and it's lessened 21 competition relative to what would happen absent the 22 acquisition. So this counterfactual is inherently 23 forward-looking, requires us to consider what 24 competition would be in the future, both with and

without the acquisition.

1	So just as General Dynamics teaches that we
2	have to consider factors that can reliably be said to
3	predict, you know, diminished future competitive
4	significance for incumbents, we need to apply the same
5	sort of thinking to nascent and potential competition
6	and ask where we can reliably predict what the future
7	effects of nascent and potential competitors might be.
8	Again, this symmetry problem comes into play, and, how
9	you know, our going-in biases affect how we look at
10	that issue on each side.
11	I'm running well past my time here, but we will
12	try to wrap this up.
13	MR. SAYYED: You can keep going.
14	MR. DENIS: The perceived potential competition
15	doctrine, three primary elements here, market
16	structure, uniqueness, and effect, right? The market
17	has to be structured in such a way that entry likely
18	would have a procompetitive effect. Normally we look
19	at concentration as being the indicator there.
20	Uniqueness is a second requirement. This
21	acquired company, the potential entrant, has to be one
22	of few comparable potential entrants.
23	And, finally, an effect, the prospect of entry
04	

The actual and potential competition shares the
first two elements with the perceived potential
competition doctrine, market structure and uniqueness,
but adds two others, right? The actual potential
entrant actually has to have a plan, right? There has
to be a subjective intent to enter, and objectively,
the trier of fact has to conclude that they have the
capacity to enter.
Finally, that entry has to be likely. You
know, the Commission's B.A.T. decision is probably one
of the more focused opinions on this point, and on the
likelihood requirement, the Commission applied an
elevated standard of proof. There had to be clear
proof that entry was, in fact, likely.
So because those elements of proof were
difficult for plaintiffs, there arose a number of
alternative doctrines to try to get around the
potential competition doctrine yet incorporate concepts
of nascent and potential competition into the analysis.
You know, they are themselves innovations. These are
the concepts in innovation markets, technology markets,
and R&D markets. Given where we are on time, we will
leave the details of these to discussion on the panels.
So filling out the framework, where do we need
to go with this? We have a well-developed framework.

1	have some reasonably good empirical evidence that it's
2	not predictive. So this is an area where actual
3	nascent and potential competition, you know, shares a
4	weakness with horizontal merger analysis, and, you
5	know, a little more in the way of retrospective
6	analysis and testing of our predictive tools is in
7	order.
8	Probability, we're talking about two things
9	that are inherently probabilistic events, you know, a
10	nascent competitor becoming, you know, more competitive
11	in the future, a potential entrant coming into a market
12	in the future. These things are not black and white.
13	They may happen, they may not, and we don't have a

## **202** 10/17/2018

1	behind the curtain of nonpublic investigations. So
2	with the help of my colleague, Konsta Medvedovsky, we
3	took a look at the Commission's enforcement practice in
	•
4	pharmaceutical mergers to see whether that might tell
5	us a little something about, you know, what is the
6	probability of success that you have to have before
7	you're really going to count these nascent and
8	potential competitors.
9	And, you know, we can talk later about the
10	details of this, but our preliminary view suggested
11	that the answer might be something north of 60 percent,
12	and we get there by looking at the Commission's
13	enforcement practice involving pipeline branded
14	pharmaceutical products, but certainly when you look at
15	the pharmaceutical area and Mike Moiseyev's here and
16	he knows this better than anybody the Commission has
17	considerable experience, has a well-developed
18	reputation for thoughtful enforcement in this area, and
19	does not go chasing after low probability events.
20	The last point here is the temporal dimension
21	of the analysis. You know, we don't have clear
22	guidance on the time frame. If you remember back to
23	the '92 Guidelines, we used to talk about supply
24	responses occurring within a year in response to a
25	SSNIP that lasted a year. We talked about entry

**203** 10/17/2018

1	complete, how sufficient is this analytical framework
2	that Paul laid out and potentially offer alternatives
3	or additional considerations that the agency needs to
4	take account of.
5	So I've already introduced Susan and Paul.
6	Lina Khan is on the panel. She is presently a Fellow
7	at Columbia University Law School.
8	John Newman is an Assistant Professor at the
9	University of Memphis School of Law.
10	Bill Rogerson is the Charles and Emma Morrison
11	Professor of Economics at Northwestern University.
12	Steve Tadelis, who has been on a panel earlier
13	in this three-day set of hearings, is a Professor of
14	Economics, Business, and Public Policy at the
15	University of California, Berkeley, Haas School of
16	Business.
17	And Will Tom is a partner at Morgan Lewis.
18	There is more information in their bios or
19	background on the web.
20	Right now I'll turn it over to Lina to begin.
21	We will go right down the row. We will give Susan and
22	Paul a chance to respond, and then we will have each
23	panelist respond to each other. And, of course, we'll
24	take some questions from the audience.
25	MS_KHAN: Great_thank you_Thank you to the

25 MS. KHAN: Great, thank you. Thank you to the

- 1 FTC for inviting me and to OPP for putting these
- 2 together. I know it's taken a lot of work.
- 3 So I am going to discuss potential competition
- 4 in the context of digital markets, specifically
- 5 discussing how safeguarding potential competition in
- 6 these markets is especially important. There's been
- 7 significant debate in the last few years about the
- 8 growing dominance of a small number of tech platforms
- 9 and the role they now play as key arteries of commerce
- 10 and communications.
- 11 I think a key fissure in that debate is whether
- 12 any of the dominant platforms are already using their
- 13 dominance in ways that undermine competition such that
- 14 it should be within the purview of the antitrust laws.
- 15 I think wherever you fall within that debate, steps
- 16 taken by these firms to solidify their positions
- 17 through eliminating future challengers should pose a
- 18 huge concern to everybody.
- 19 That is, even if you believe that the current
- 20 dominance of these firms is nothing to worry about
- 21 because we're going to see the, you know, inexorable
- 22 forces of creative destruction swoop in and dislodge
- 23 their dominance, that can only be true if tomorrow's
- 24 innovators are not blocked by today's incumbents.
- 25 So in light of this, I think preventing mergers

1	that entrench the positions of leading incumbent tech
2	firms by eliminating future challengers should be a key
3	priority for the antitrust agencies. When thinking
4	about potential competition challenges, I think there
5	are a few areas that deserve significant attention.
6	One is entry barriers. So entry barriers are
7	important to this analysis because, as we heard from
8	Paul, the potential competition framework includes an
9	analysis of whether there are some limits on the
10	entrants that are positioned to enter. In digital
11	markets, data and analytics capabilities can be a
12	significant barrier to entry.
13	Some would argue that aggregation of data does
14	not pose a competition problem because data are
15	nonrivalous, but I think in practice, data that is
16	significant for competition purposes might be costly
17	and difficult to obtain, so there's going to be little
18	incentive to share.
19	This is not new to the FTC. The FTC recognized
20	that data can serve as a significant entry barrier, so
21	in the Nielsen-Arbitron case, it determined that
22	proprietary data held by the firms would be key inputs
23	for downstream services that were still nascent, and
24	the consent order included divestiture of certain data
25	accata

1	I think another reason that it's important to
2	consider the role of data as a barrier is that data
3	advantages can be self-reinforcing, which means that
4	for a new entrant, gathering enough data can test an
5	incumbent, will be a significant challenge.
6	So what does this mean for potential
7	competition analysis? I think the fact that data does
8	serve as an entry barrier suggests that in many digital
9	markets, there will be a significant limit on the
10	potential entrants, which is what renders potential
11	competition analysis so salient, and by extension of
12	that, because potential competitors are less likely to
13	emerge, it is especially crucial that when they do
14	emerge, antitrust safeguards that potential
15	competition.
16	So, the second challenge is what I call the
17	Onavo problem. So Onavo is a company that Facebook
18	acquired in 2013. It's a VPN provider that grants
19	users heightened security, but it also allows Facebook
20	to track in extremely close detail which rival apps are
21	diverting attention from Facebook, which means that
22	Facebook can detect, at the very earliest stages of a
23	company's growth, which competing apps might pose
24	competitive threats.
25	This information then shapes Facebook's

1	I want to quickly address two arguments that
2	are sometimes made to caution against aggressive
3	enforcement in these markets. So one is the idea that
4	there's a risk of short-term, immediate consumer harm,
5	given that an incumbent that acquires a startup may
6	offer the quickest path to market. I think it's a very
7	reasonable consideration.
8	I think business literature and experience
9	suggests that while incumbents may be more successful
10	at delivering innovation that continues on established
11	research paths, it's really the startups and the new
12	

**209** 10/17/2018

**210** 10/17/2018

**211** 10/17/2018

- 1 applaud. I didn't mean to get in the way of you
- 2 applauding. Thank you.
- 3 We'll turn to John now.

4 MR. NEWMAN: All right. So I'm going to start

5 off by making a claim that I think would have been

6 really uncontroversial five years ago. It's starting

7 to feel a little risque, though, these days, and that

8 is that our current basic legal framework, at least as

9 applied to sort of core issues like horizontal mergers

10 and acquisitions, is not totally broken.

11 So how do I base that claim? I'd say that we

12 can look at the types of cases the agencies have been

13 bringing. I'm going to focus on digital markets since

14 a lot of the talk about nascent competition has to do

15 with digital spaces.

16 The agencies have been bringing a surprisingly

- 17 broad variety of cases, different types of cases in
- 18 different digital markets, along a spectrum, right? So
- 19 you had FanDuel-DraftKings, where there were two actual
- 20

1	None of these cases attracted a deluge of
2	criticism, so to me that tells me two things. The
3	agency is being active and they're not making egregious
4	mistakes. So if the basic, basic legal framework seems
5	to be functioning fairly well, are there nonetheless
6	some sorts of areas that are voids in the current
7	enforcement regime? And another way to put that
8	question is to say, what's prompting all the calls that
9	we're seeing for stronger antitrust enforcement in
10	digital markets?
11	To me, there is a big gaping void in the
12	current framework, and that has to do with zero price
13	markets. So none of those cases I just mentioned
14	involved zero price markets, despite the near ubiquity
15	of that model at least with consumer-facing platforms.
16	So none of these cases involved a zero price market.
17	A lot of people have responded to that void in
18	enforcement by urging a focus on data extraction or big
19	

- 1 parties who then target consumers with advertisements
- 2 or using it to target advertisements -- that really
- 3 reflects derived demand.
- 4 So the demand for data here is derived from the
- 5 demand for advertising, right, the demand for
- 6 attention. So to me the core area of concern and where
- 7 there seems (atrgy .ro8 531.42 Tm -.0001dry)-d6dw-ue c en94 cy

1 So attention is the currency in these markets. 2 So the objection is essentially the exact equivalent of 3 saying all firms compete for money, so there must be 4 one big market that's really unconcentrated, which is 5 laughable. 6 The second objection, we already look at harm 7 to innovation on the user side, the zero price side, 8 the attention rivalry side of a lot of platforms. This 9 is true or it seems to be true, at least, if you look 10 at something like Zillow-Trulia. The agency reported 11 that it looked for harm to innovation on the user side 12 of the platform. Is that enough, though? Is that 13 sufficient to allay all concerns or find all concerns? 14 I don't think so. Unfortunately, we don't 15 have, as we've heard today, a really strong economic 16 theory or econometric tools that we can use to assess 17 innovation effects in a merger context, and to sort of 18 worsen the problem, the qualitative evidence that we 19 would usually rely on in the absence of a nice economic 20 theory is not likely going to be there. 21 So if we think about what we'd be looking for, 22 it would be maybe a board presentation, right, where a 23 CEO is trying to sell an acquisition to the board by 24 saying, oh, after the merger, we're not going to 25 innovate anymore; never going to happen. So the types

**216** 10/17/2018

1	a specific way. With digital firms in particular,
2	there is often a great deal of AB testing that goes on
3	in the marketplaces, really easy to do that in a
4	digital market. To the extent that the FTC could ask
5	for the results of AB testing when firms are changing
6	advertising loads, and looking at the competitive
7	results of that, I think that would be a fantastic idea
8	and would help give us an idea of what happens in a
9	digital market when a dominant firm increases
10	advertising loads to users. Where does that
11	substitution go to? And it could be a really useful
12	tool for us to use.
13	MR. SAYYED: Okay. Thank you, John.
14	We will turn to Bill Rogerson now.
15	MR. ROGERSON: Great. Well, thank you very
16	much for having me here today, and thanks for doing
17	such a great job organizing this very timely
18	conference.
19	My understanding is the first panel is supposed
20	to focus on two questions. First, what framework
21	should we use to evaluate mergers between incumbents
22	and nascent competitors in high-tech industry? And
23	second, is the current law and the current version of
24	the Merger Guidelines consistent with using the correct
25	framework, or would the law or the Guidelines have to

- 1 be changed or altered in order to use the correct
- 2 framework?

3 I'm going to focus more on the first question

4 of what the correct framework should be because I think

5 this is a question that economics can shed the most

6 light on, and I'm an economist; however, let me very

- 7 briefly say, regarding the second question, that I
- 8 agree with a lot of what has been said earlier, that I
- 9 view the law and the Merger Guidelines as relatively
- 10 general statements, flexible general statements of

11 general principles that are pretty sensible, and my own

- 12 nonlawyer view of it is that one could interpret
- 13 existing law and the existing Merger Guidelines as
- 14 being completely consistent with a sensible and correct
- 15 welfare analysis of the problem. So I don't think
- 16 there's any need to change the law or even to change
- 17 the Merger Guidelines. I think all the right
- 18 principles are in place.

19 If I was on the next panel that's supposed to

- 20 address should we get a little tougher on any mergers
- 21 or have we been looking at these mergers as carefully
- as we ought to using the correct framework, I'd
- 23 probably say, given the events I've seen in the last
- five years, looking back on them, that possibly
- 25 regulators should be a little tougher or look more

1	closely at a number of mergers, and perhaps there have
2	been a number of mergers that have been approved that,
3	at least in retrospect, with hindsight, one wonders why
4	they were approved or whether they really should have
5	been or whether there was enough evidence at the time
6	to decide that perhaps that they shouldn't go forward
7	with, but I don't think there's really any need for a
8	change in the law, and I think the basic elements of
9	the correct framework are in place.
10	What I'm going to do today is focus on one
11	specific issue related to what the right approach is,
12	and what I'm going to do is describe two different
13	social welfare problems that we could attempt to solve
14	when we were choosing a policy on how to evaluate these
15	types of mergers, all right?
16	The first policy is going to be not quite
17	correct and be extremely complicated. The second
18	policy is going to be exactly correct and fantastically
19	more complicated than the extremely complicated policy.
20	And one message I want to leave you with today is, is
21	that I wonder whether or not we should be considering
22	using the not quite correct policy because it's a type
23	of welfare evaluation, although it's extremely
24	complicated, and I could imagine evidence being brought
25	to it and evaluated, whereas the second perfectly

1	correct question I'm not so sure this is the case.
2	Okay. So let me start, just as a benchmark,
3	with describing what I think the standard competition
4	problem is when two mature firms come to the DOJ or the
5	FTC and say we'd like to merge, okay? Because there
6	you know, and, of course, we really just look at the
7	competitive try and assess the competitive effects
8	of the merger, to see to what extent it would cause
9	competition would be reduced and price would go up,
10	quality would go down, or perhaps even look at
11	innovation effects, on the one hand, and then on the
12	

1 consumers will want to use it or whether they'll view 2 it as a substitute for the incumbent's product or not 3 or to what extent they'll view it as a substitute. So 4 there's a huge amount of uncertainty about exactly how 5 this nascent product will fit into the market. 6 Well, I think there are two different welfare 7 problems you could consider when you are asking should 8 we approve this merger, okay? The first one I'm going 9 to call "the ex post problem," and the reason I call it 10 the ex post problem is I'm going to say let's take as 11 given that we have that startup today who's already 12 done all of the startup innovation that he did. He's 13 already come up with a new idea, tried it out a little 14 bit in practice, and he's ready to go, or, you know, 15 he's nascent, but he's done a lot of work already. 16 He's already done this preliminary innovation, okay? 17 Well, at that point, taking that as given, the 18 competition problem we're looking at with the mature 19 firm and the nascent firm is very similar to the 20 problem we look at with two mature firms, only there's 21 a lot more uncertainty about exactly what the 22 competitive effects are and what the nature of the 23 efficiencies are, right? But in principle, it's the 24 same type of problem. We've got two firms. We want to

assess the competitive effects. It's going to be

1 harder to do this because it's more forward-looking, 2 relying on more predictions. We're not quite sure if 3 the start up -- you know, number one, would the startup 4 succeed if it was by itself, or really has it only come 5 up with an idea that would be useful for an incumbent 6 firm? 7 Perhaps it was never even really trying to 8 think of a stand-alone idea. Really perhaps the 9 efficient way to organize innovation in this industry 10 was simply that little startups think of new ideas that 11 existing incumbents are better at implementing. So 12 that could be what's going on. 13 On the other hand, it could well be an idea 14 that could grow into a new product that really would 15 challenge the rival, okay, but it's uncertain. So if 16 we went ahead and did this analysis, we'd still try and 17 determine whether consumer surplus will be higher or 18 lower with or without the merger, but there's going to 19 be more uncertainty. So it's going to be a much harder 20 problem and maybe harder to draw the conclusion that 21 the merger will be bad. 22 On the one hand, if we allow the merger, the 23 incumbent firm will get this technology and use it in 24 some sense, although we don't even really know how the

25 incumbent firm will use it, okay? If we disallow the

- 1 merger, it's possible the startup will just go down the
- 2 drain or it's possible that if the startup survives,
- 3 the product still won't be nearly as good as if the
- 4 talented incumbent, who knows how to implement a new
- 5 product, had taken it over.

- 1 the real world, surely you'd like to take or
- 2 potentially you'd want to take into account the fact
- 3 that when I choose a merger policy, I'm going to make a
- 4 startup innovation more or less profitable for
- 5 startups. In particular, if I make it easier for
- 6

1 yet worked this out in a formal model, if we wrote down 2 the formal model in a well-behaved model, we would 3 predict that the fully optimal solution might be to be 4 a little more lenient on mergers than the one that just 5 implemented perfectly efficient ex post policies. 6 That's because innovation is generally good for 7 consumers. 8 So it might be desirable, at least in theory, 9 to commit to a policy where you purposefully commit to 10 approving some mergers that are inefficient ex post in 11 order to create better innovation incentives ex ante, 12 okay? 13 Now, the second problem, the ex ante problem, 14 is the perfectly correct problem, okay? But it's a 15 complete order of magnitude harder than the ex post 16 problem, which is already a complete order of magnitude 17 harder than the standard problem, okay? 18 Usually when I hear of experts on existing 19 antitrust laws kind of get into the details of how they

2Tj 11.94 0 0 11.94 115ng1 Tmm7is8ve -.0].lyze.0] actu98.5ubok2sm Tm -.0001 Tcu98.5ubok

1	don't consider the issue of what effect will this have
2	on innovation incentives of startups going forward.
3	I think that might be the right idea. I'm not
4	sure, but I want to submit to you that this might not
5	be a bad idea for two different reasons. I think that
6	it's possible that this ex post problem is a problem
7	that's simple enough that courts could actually
8	evaluate it, and if you ask courts to evaluate problems
9	where there's just going to be completely no factual
10	basis for arriving at any sort of possible reasonable
11	conclusion, you're just inviting them to give their own
12	opinion. And so it might be better to restrict us to a
13	fairly good question that they really can potentially
14	answer, that's going to rely on some objective facts
15	that can be presented before the court.
16	The second thing is, I'm not sure the two
17	problems would necessarily yield that different an
18	answer anyhow. I think if you've got a correct ex post
19	policy, you're still going to allow plenty of mergers
20	where the mergers would have never had any hope really
21	of launching a separate firm. They're really just
22	little ideas that the incumbent would have used anyhow.
23	And if you apply that policy sensibly, I think you're
24	going to allow a lot of these mergers, and there still
25	will be good merger incentives.

1	And secondly, there's a countervailing effect.
2	If you loosen up your merger policy to get the startups
3	to invest more, the incumbent is going to invest less,
4	and that's going to be bad. So there's a countervailing
5	effect. If you try and loosen up policy away from the
6	efficient policy, trying to get more mergers, to more
7	innovation, it just may be that the incumbent will
8	frustrate you by investing less.
9	So, on balance, I'm not sure that the slightly
10	easier problem isn't that bad a problem in any event,
11	and at a minimum, I think it's a problem that courts
12	could potentially address. Maybe the way this really
13	would work out in practice, often in real cases people
14	always talk about what's the probability that we have
15	to show that the startup would succeed? How high does
16	that probability have to be? How certain do we have to
17	be that the firm would survive by itself and actually
18	be a good competitor?
19	All right, maybe in a theoretical world, you

20k11791.8(that probability haathat baobaduced ficient podecisn, )]TJ T\* [(4)2-1791.8(coexote

- 1 And I might imagine that the real problem that
- 2 courts and enforcers will always think of themselves as
- 3

- 1 actually speaking, because the way things were going,
- 2 that wasn't certain.
- 3 Like Bill, I do believe that the current
- 4 welfare analysis is the preferred tool, not
- 5 surprisingly. I'm an economist, but I think these
- 6 tools need to be carefully applied, because one thing
- 7 that isn't said enough is that not all platforms are
- 8 created equally. They don't all have the same business
- 9 model. They don't all have the same barriers to entry.
- 10 So there's a lot of discussion that people seem to lump
- 11 together.
- 12 I heard this earlier. Oh, the Google/Facebook/
- 13 Amazon/Apple, right? These are all different
- 14 companies, different business models, and the devil's
- 15 in the details, and I think that's something that is
- 16 not said enough, which is why I wanted to start with
- 17 that.
- 18 Now, going to a theoretical -- a broad
- 19 theoretical perspective, there is no question that
- 28 Tm 0 Tc (12)Tj 12 0 T1 ,cne7rearl

- 2 quantity. That's an easy one.
- 3 The innovation thing is not as easy. So going
- 4

1	not good, too much is not good, some healthy middle
2	appears.
3	Now, I was very happy that Paul mentioned that
4	we should encourage our graduate students to work on
5	this topic. As it so happens, one of my graduate
6	students, who is on the job market this year, has
7	written a beautiful paper where he did something akin
8	to retrospective analysis, which is not easy to do,
9	spent a year and a half gathering data, where he took
10	data from the DOJ's cartel breakup history, which
11	clearly was an exogenous shock to competition, because
12	one of the things we worry about and the reason
13	empirical work is so difficult here is that competition
14	and innovation are both determined not only by the
15	relationship between them, but by what we call latent
16	or lurking variables, and it's really hard to tease
17	that causation/correlation story.
18	So what he did, he went back 30 years,
19	collected data of breakups in different markets,
20	defined the market carefully, treatment control.
21	Obviously, like any study, there are some assumptions,
22	but what he showed is actually that more competition
23	creates less innovation measured by patent investment
24	filings, by patent breadth, and by R&D investments. So
25	I think the verdict is out about what is the right

1 amount of competition and, by extension, nascent 2 competition in order to get innovation from the theory 3 side. 4 Now, let me turn a bit to practice, because in 5 theory there is no difference between theory and 6 practice, but in practice, there is, and I was inspired 7 by Susan and a handful of other economists who actually 8 spent time in industry. I spent two years at eBay 9 building and leading a team of economists. I spent a 10 year at Amazon, also leading a team of economists and 11 kind of, you know, seeing how things actually work and 12 their relationship with startups and innovation more 13 broadly.

**233** 10/17/2018

## 1 Because execution is so difficult, it is those 2 large companies who succeeded time and again who have 3 put together the apparatus that helps with execution, 4 and that is complementary to the success of many of 5 these startups. So if we go to that question, kind of 6 like that ex post idea that Bill promoted, we have to 7 ask ourselves, if we allow this merger to happen, what 8 will probabilistically happen in the future? And are 9 there really barriers to entry for future competition 10 that might be foreclosed if we allow certain mergers to 11 happen? 12 And in platform markets, which is really what 13 we're talking about here, those barriers to entry are 14 primarily about indirect network effects, and those are 15 going to be a barrier if, one, multihoming is costly, 16 and, again, Susan talked about multihoming a lot; and, 17 two, acquiring new customers is difficult, which, 18 again, Susan mentioned at length. 19 And these are tightly connected, because if 20 multihoming is easy, acquiring customers is easy. So 21 my observations from my experience on the tech sector 22 more broadly, but especially retail marketplaces --23 since everybody else ignored the "Time's Up" sign, I 24 might do that, too --

25 MR. SAYYED: Don't worry.

1	MR. TOM: Don't worry. I'm the competitor
2	waiting in the wind.
3	MR. TADELIS: I know.
4	Then first of all, for many products and
5	services, multihoming requires two or three clicks and
6	two queries. So whenever I choose to buy something,
7	within less than two minutes, I could compare Amazon,
8	eBay, and Walmart and I often do if it's a more
9	expensive product and truth be told, if it's a \$12
10	product, I'm not going to bother, because if I'm
11	screwed by 40 cents, that's okay. I can live with
12	that. Again, every time I do those comparisons, I find
13	the prices to be extremely similar.
14	Second, every time I take a ride, I have Uber
15	and Lyft on my phone right next to each other. In 45
16	seconds, I will have that price comparison and time
17	comparison. Sometimes I'm in more of a hurry and I
18	will pay a dollar more to get there faster. Sometimes
19	I'll rather save that dollar and wait another few
20	minutes.
21	Then the second thing is that early-stage entry
22	has become extremely cheap and very easy to do
23	precisely because of a lot of platforms that came up
24	like cloud computing services. What used to be a
25	capital expenditure, buying millions of dollars of

1 servers, is now pay-as-you-go computing and storage, 2 and that makes the early stages of entry very, very 3 easy, and here I'm echoing something that Lina said. 4 Barriers to entry are really critical to look at, and 5 for startups in the tech sector, barriers to entry in 6 early stages have declined dramatically. 7 Last, but not least, VC funding is really 8 thirsty for potential entrants. One example is 9 Jet.com. Four years ago, the company was founded. 10 They raised close a billion dollars in venture funding, 11 and shortly after that, they were bought by 12 Walmart.com, and now they are driving Walmart's -- most 13 of Walmart's online platform. 14 So going to another point that Lina mentioned, 15 and she quoted Hal Singer from the previous panel, who 16 mentioned this decline in VC funding. Well, there's a 17 study by Oliver Wyman -- albeit funded by Facebook, so 18 full disclosure, that's what I read -- but it shows 19 that VC funding is at record highs. What has changed 20 is where the VC funding is coming in. 21 Rather than coming in at early stages, it is 22 now coming in at later stages of investment. Well, if 23 you think about the reduction in barriers to entry to 24 start a startup, that makes complete sense. That is a 25 market reaction. E s 1r'am1 Tm in.

- 1 MR. SAYYED: Thank you, Steve.
- 2 So let's turn to Will.
- 3 MR. TOM: Thanks, Bilal.
- 4 I am going to confine myself to two categories
- 5 of comments, one on the nature of the tools and the
- 6 second on the management of the tools.
- 7 So on the nature of the tools, I fully agree
- 8 with Steven that the tools are adequate. I think the
- 9 agencies have a very full toolbox. In fact, I think
- 10 the toolbox is kind of overflowing, and therein lies a
- 11 risk.
- 12 So I think the technical term for what has
- 13 happened to the toolbox over the last couple of decades
- 14 is the tools have evolved in r2htt9p56 Tb Tm t last couple of .h decades

1	in the Time Warner-Turner merger that the FTC handled
2	more than a decade ago, and the notion that you see in
3	the analysis to take public comment is that the share
4	of foreclosure is a function of what is actually needed
5	by the complementer, and so, you know, there the theory
6	was the barriers that would be posed by new programming
7	entities by control of more of the conduit, and the
8	notion that you'll see in the analysis there was to
9	launch a significant new program or programming
10	network, you needed to be able to reach about 60
11	percent of the subscribers nationwide.
12	Well, you know, the inverse of 60 percent is 40
13	percent. If you can foreclose 40 percent, that's
14	enough. You don't need the traditional monopoly share
15	or anything like that. And so instead of a bright
16	line, you know, suddenly it was a measurement that
17	depended on the circumstances of the case and the
18	competitive theory involved, okay?
19	So as these tools have gotten squishier, the
20	risk of misunderstanding has increased, and one example
21	near and dear to my heart is innovation markets, which
22	is a term that the 2017 IP Guidelines has finally
23	gotten rid of, and probably a good thing even though
24	there was nothing wrong with the underlying concept.
25	It's just that as interpreted and applied pabody

25 It's just that as interpreted and applied, nobody

1 seemed to understand what that underlying concept was. 2 The concept came about as a direct result of 3 the GM-ZF merger in which you had two companies that 4 barely competed at all in the downstream goods markets, 5 just as a geographic matter, but it happened that to 6 innovate in this product market, you needed a massive 7 amount of manufacturing facilities, and there was an 8 iterative, iterative process between the manufacturing 9 and the innovation, and these were the only two 10 companies that had it. 11 So even though they didn't compete much 12 downstream, they competed heavily in innovation, and 13 the benefits of that leapfrogging competition was felt 14 worldwide, even in markets in which they did not 15 compete, in the goods markets. And so the focus of the 16 innovation market theory was on specialized assets. 17 So if you had a type of innovation that anybody

that very, very few players had it. So, you know,
that's one set of issues that posits an example of the
danger of the risk of misunderstanding as these
concepts become more elastic.
I think, you know, currently, this notion of
acquisitions of data may be another area that we really
ought to think hard about before we leap at the latest,
shiniest theory. I don't think these are really zero
price markets. I mean, for the most part, when you're
looking at mergers of two companies with significant
caches of data, you're really talking about data
acquisitions as input purchases.
They're getting data. Those data are useful to
them in their business and helpful to them as they
compete downstream, and they are paying a price to get
that data. It's not a monetary price. They're paying

- in the form of offering consumers services.
- So, you know, the old joke is that if you're
- paying a zero price, you're not the consumer, you're
- the product, okay? And I think, you know, that that
- has a lot of truth in how we ought to think about these
- mergers.
- Okay, so another point about the nature of the j9ps6dolsou know, of misu ui-

- 1 and, you know, look, the asymmetries that Paul pointed
- 2 to in terms of when we look at potential entry as a
- 3 potential anticompetitive harm and when we look at
- 4 potential entry as curing a harm from a merger, they're
- 5 not always symmetric.
- 6

**243** 10/17/2018

1	know, you need to make those tradeoffs carefully.
2	Okay, let me just turn very quickly to a couple
3	of words about management. When I was at the
4	Commission, there was a Commissioner who was very fond
5	of behavioral economics and was an advocate of applying
6	it at every possible turn, and I could understand how
7	it applied to our consumer protection mission, and I
8	never could quite get how it applied to our competition
9	mission until it hit me one day that if you turned the
10	telescope around and trained it on the enforcers,
11	behavioral economics would tell you quite a bit about
12	the cognitive biases of the people within the building
13	who were doing these investigations and making the case
14	recommendations and voting on the case recommendations.
15	When it struck me, it seemed like a brilliant
16	insight, until just a couple of days ago when I was
17	searching the web for something else and I stumbled
18	across a really nice article written by Bill Kovacic
19	and Jim Cooper that made exactly that point. So
20	there's nothing new under the sun, but we should pay
21	attention to the fact that narratives are powerful.
22	They're especially attractive when they seem like novel
23	insights, you know, and my feeling about or, you know,
24	my belief that, gee, I had this brilliant idea about
25	behavioral economics, might be an example of that,

## 1 where you weigh much more heavily things that are novel 2 and exciting and fun, and you stick to them even if a 3 sober analysis of the potential consequences might lead 4 you in the other direction. So that's point one on 5 management. 6 A second point is, you know, attitudinal 7 approaches. Former Acting Chairman Ohlhausen has 8 spoken a lot about regulatory humility, and that, and 9 that, I think, scratches the surface of what enforcers 10 might think about as they approach some of these new 11 complexities. I also think we should think about some 12 process approaches to managing these tools. 13 One thing that always struck me was there has 14 been an unwritten rule that's grown up at the FTC about 15 the number of meetings you get with the Bureau 16 Director, and it's colloquially referred to as the "one 17 meeting rule," and I think it makes a lot of sense in 18 traditional horizontal mergers where, you know, the 19 volume is such that if you allowed more than one 20 meeting, you'd never do anything else, and the 21 analytical paths are straightforward enough that 22 additional meetings wouldn't help very much. 23 But in novel and cutting-edge areas, I would 24 really like to see that unwritten rule abolished. I

think there's nothing worse than having the staff go

- 1 down a particular route or, you know, pursue a
- 2 particular hobbyhorse, maybe driven by some of these
- 3 cognitive biases I was talking about, and work for
- 4 months and months or years on a matter only to -- you
- 5 know, when management finally pays attention, to find
- 6 that there are whole dimensions of the issue that they
- 7 have overlooked. So a "one meeting rule" -- devil's
- 8 advocate -- I think can be very useful and maybe ought
- 9 to be formalized.
- 10 People have talked about retrospectives, and I
- 11 heartily endorse that, although they'e mos 0 o0r9cTj ae22.9n 710.4 Tm 0 g 19 di12 1rce

1	PANEL 4: NASCENT COMPETITION:
2	ARE CURRENT LEVELS OF ENFORCEMENT APPROPRIATE?
3	MS. WILKINSON: Welcome back, everyone, to
4	our afternoon session on Nascent Competition in Digital
5	Markets. My name is Stephanie Wilkinson. I am an
6	attorney advisor in the FTC's Office of Policy Planning
7	and I will be moderating this next panel.
8	So we just heard a really good discussion
9	during the last panel regarding the analytical
10	framework for evaluating acquisitions of nascent or
11	

1	about and it would have been helpful had I
2	coordinated with the prior session because some of
3	these themes have been covered, which means it was a
4	successful session. And what I will do is I will
5	reposition, the way that either every incumbent or new
6	entrant has to when something interesting happens.
7	So I thought my own framing of how to think
8	about these markets was slightly different than other
9	people's. It was not Paul's focusing on law; it was
10	not some of the others focusing on economics. I
11	thought about it in the following ways by giving two
12	possible examples. One is what does nascent
13	competition mean; one is where we have a nascent
14	competitor; one is where we have a nascent market.

**248** 10/17/2018

- 1 So I am actually going to focus on something else. Two
- 2 different things.
- 3 One is the changing VC ecosystem. So again 4 if we are thinking that tech equals platform tech, then 5 it is fascinating that up until now what we have not 6 really heard about are, for example, three very large 7 tech companies in China with a number of other large 8 companies. If we are looking, for example, by market 9 cap or by revenue, these are significant players as 10

1 was roughly some \$30 billion. 2 And the way that they are trying to make 3 investments in corporate venture capital is much the 4 same way that we are seeing in traditional venture 5 capital, but somehow it might benefit the company in 6 new and interesting ways. People forget after Peter 7 Thiel invested in Facebook. Do you know who one of the 8 next major investors was? A little company you have 9 never -- a venture capital company you have never heard 10 of called Microsoft. Okay? We see this kind of 11 innovation in corporate venture capital. 12 But based on what Will Tom said, I am going 13 to throw in yet a third thing not on the slide. This 14 is how you know I am repositioning. And that is there 15 is a lot of investment just short of actual financial 16 investment. So think of any kind of strategic 17 alliances, licensing agreements, joint ventures, et 18 cetera, just short of actual merger type ownership 19 integration but something akin to a financial 20 investment. 21 So we will zip through yet again. So I think 22 I am going to preview something that the next panel is 23 going to talk about and that is for years I pushed on 24 Commissioners on both sides of the aisle the importance 25 of having a tech group. I have a different vision for

- 1 what this might look like than what you have heard
- 2 before.
- 3 I think very clearly a tech group needs to be
- 4 under the purview of the Bureau of Economics. There is
- 5 a reason for this. Because it turns out -- and this
- 6 goes to something Bill Rogerson raised and so I think
- 7 it was masterful for a number of reasons, but I want to
- 8 summarize some of the takeaways I got from his
- 9 talk -- A, it turns out that we learn by analogy and we
- 10

1	ways of seeing how these experimentations work. One is
2	the competition market's authority in the U.K. that is
3	doing spectacularly interesting work in this area. The
4	other is the President's Council of Advisors on Science
5	and Technology where you actually bring in experts from
6	the field for a while. Wouldn't that be awesome if we
7	had very high level experts coming into the Federal
8	Trade Commission the way we do with the spectacular
9	economists that spent two years from the academy? And
10	I will just end there. Thanks.
11	MS. WILKINSON: Okay, thank you, Danny.
12	Next we will hear from Diana Moss, who is the
13	President of the American Antitrust Institute and
14	adjunct faculty in the Department of Economics at the
15	University of Colorado at Boulder.
16	MS. MOSS: Thank you, Stephanie. And thanks
17	to the Commission for holding these hearings and to OPP
18	for mustering the significant resources to plan and
19	organize them, and especially to Stephanie and
20	Elizabeth here for really doing a lot of prep work on
21	this particular panel, which I think hopefully will
22	show through in the discussion here today.
23	So just for openers, I want to make three
24	broad framing remarks. One is, what we are here to
25	talk about, the level of enforcement, antitrust

1	enforcement involving digital markets and especially
2	nascent acquisitions of nascent competitors is
3	adequate or should it be higher or lower, what should
4	it be.
5	So my observation is that history tells us
6	that the levels of enforcement, this type of
7	enforcement is pretty low actually. So AAI collects
8	data on enforcement levels across long spans of time.
9	We just filed a letter on the SMARTER Act and included
10	data in there showing about a two-and-a-half percent
11	challenge rate across both agencies from about 2000 to
12	present day.
13	So if you look at the number of acquisitions
14	in the digital market spaces, over the last three
15	decades, we are looking at these are major
16	acquisitions. Rough cut numbers, do not cite or quote.
17	But we are looking at upwards of almost 700
18	transactions. And I would query everybody in the room
19	here go back through your mental Rolodexes and ask
20	yourself which acquisitions have been challenged by the
21	FTC or the DOJ, and the list is very short.
22	That does not mean that enforcement is too
23	low or too high. It means that it is a question. It
24	raises a legitimate question. So it is not because the
<u>م</u> ۲	energies are not locking an east ing and finding an est

25 agencies are not looking or seeking and finding or not

- 1 finding potential violations of Section 7. It could be
- 2 because the agencies are not using the right lens and
- 3 that would be my argument. That it is a lens problem.
- 4 We are not asking the right types of questions. We are
- 5 not looking at stepping through the merger guidelines
- 6 methodology in a way that would be conducive to
- 7 properly identifying and framing potential competitive
- 8

- 1 rates are high. You know, what do we do? Do we throw
- 2 our hands up and say, you know, hands off, we are not
- 3 going to get involved here or do we actually try and

4

1

## to -- are certainly adequate and flexible enough. We

2 have models. We have theories of competitive harm. We 3 have many observations about conduct involving firms in 4 markets with very high levels of concentration. 5 But what we need to do is use the consumer 6 welfare standard to the full extent of its 7 capabilities. And that would be what I call a dynamic 8 consumer welfare standard. That means we look at 9 dynamic effects on the competitive effects side. That 10 means looking at short-term price effects, but also 11 longer term dynamic effects around quality, variety, 12 innovation, even choice, consumer choice. But we also 13 look at dynamic effects on the efficiencies side. 14 Right now, arguably, and I am sure many of 15 you will disagree with me, antitrust has really 16 suffered greatly from looking at very static effects on 17 the competitive effects side, but then allowing very 18 dynamic efficiencies as justifications for 19 acquisitions. That is a very asymmetric, unbalanced 20 implementation of the consumer welfare standard. We 21 should be looking at a dynamic symmetric implementation 22 of the consumer welfare standard in this particular 23 space. I will leave it at that. 24 MS. WILKINSON: Okay. Thank you, Diana.

25 Next we will hear from John Yun. Associate

## 1 Professor of Law and Director of Economic Education at 2 the Global Antitrust Institute. Prior to joining GAI, 3 John served in various roles at the FTC's Bureau of 4 Economics. 5 MR. YUN: Thank you, Stephanie. Thank you to 6 the FTC for having me. It is exciting to be part of 7 this panel. 8 So I am going to make you really happy, 9 Stephanie. I am going to talk about one minute and 10 then let's just get started with the questions and get 11 this thing rolling. 12 Basically, when we are talking about nascent 13 competitors or technologies and potential competition, 14 we are in a dynamic setting. I think that is a good 15 place to be. Static is important but dynamic clearly 16 is harder, but it does not mean that it is not 17 important. In fact, it is probably more important and 18 I think that holds for efficiencies and entries as 19 well. 20 So the point I think I would like to make --21 and it is something that Diane just mentioned -- is 22 symmetry and I think there should be symmetry in how we 23 approach both dynamic harms as well as dynamic 24 benefits, static harms and static benefits and I think

that is the approach that we should have. Clearly,

1	elimination of competition, whether static or dynamic,
2	is important and relevant and we have to look at it,
3	but so are efficiencies and entries. I think that is
4	the story that we need to be sort of focusing on rather
5	than one side or the other, I think, to be fair.
6	So what guides us ultimately will be the
7	evidence of each particular case. We like to
8	generalize broadly what we learned or did not learn
9	from certain cases, but each case is going to be
10	different when you are in the dirty business of
11	bringing a case and analyzing a case and I think that
12	is sort of another takeaway I would like to sort of
13	establish. So with that, I will conclude my comments.
14	MS. WILKINSON: Okay. Thank you, John.
15	Next we will hear from Jonathan Kanter, a
16	partner at Paul, Weiss, Rifkin, Wharton and Garrison.
17	Prior to entering private practice, Jonathan served in
18	the FTC's Bureau of Competition.
19	MR. KANTER: Great, thanks. It is an honor
20	to be here alongside my fellow panelists and here at
21	the Commission.
22	I first stepped foot in the halls of the FTC
23	as a summer intern in 1996 after my first year of law
24	school and, at the time, the Chairman of the FTC was
25	Chairman Bob Pitofsky. He was revered then inside the

1	building, outside the building, and everywhere he went.
2	Seldom would you encounter a finer antitrust mind and a
3	finer leader in the antitrust bar. He was a model of
4	rigor, sophistication, and intellectual capability.
5	And in thinking about this session and the
6	hearings generally, I am drawn to some of Chairman
7	Pitofsky's writings. And if would indulge me, I am
8	going to read from them because I think it is a helpful
9	backdrop not just for this panel but the hearings
10	generally.
11	Chairman Pitofsky, who I think no one
12	would argue was seen sipping locally-roasted cold
13	brew in Brooklyn while listening to a 180 gram vinyl,
14	taking care of his pet rooster, I think he was a very
15	serious and rigorous antitrust practitioner.
16	"It is bad history, bad policy and bad law to
17	exclude certain political values in interpreting the
18	antitrust laws. By 'political values,' I mean, first,
19	a fear that excessive concentration of economic power
20	will breed antidemocratic political pressures, and
21	second, a desire to enhance individual and business
22	freedom by reducing the range within which private

23 discretion by a few in the economic sphere controls the

- 24 welfare of all.
- 25 "A third and overriding political concern is

- 1 realities of the market into a box, but if the boxes do
- 2 not fit then we need new ones. Or they were not the
- 3 right ones in the first place. And so I do think with
- 4 that having been said, there are some helpful
- 5 guideposts that we can use when thinking about nascent
- 6 competition both from a Section 2 perspective as well
- 7 as a Section 7 perspective.
- 8

- 1 controversial to suggest you are likely to see more
- 2 problems when you have companies with market power and
- 3 large market share.
- 4 Winner-take-all or winner-take-most markets
- 5 are likely to be more concerned for nascent competition
- 6 that could be disruptive. Monopoly maintenance,
- 7 acquisitions that intend to create a monopoly or
- 8 maintain a monopoly are the kinds of things that should
- 9 result in heightened concern -- impact on dynamic
- 10 competition.

11 Markets where there is social utility, news

12 or information, these markets have traditionally and

- 13 the law has traditionally looked on them with greater
- 14 scrutiny and greater concern because of the social
- 15 value and we should not lose that and that fits well
- 16 with Chairman Pitofsky's remarks.
- 17 The behavioral realities of participants on
- 18 the platform. So let's not try to pretend that
- 19 consumers are homogeneous. They are idiosyncratic and
- 20 often behave in unpredictable and sometimes
- 21 "irrational" ways.
- 22 Last thing is does the transaction or the
- 23 conduct relate to a conflict of interest and will the
- transaction or the conduct change the incentive and
- ability to engage in that or exercise conduct as a

1	result of that conflict of interest in a way that harms
2	the integrity and the output on the platform itself.
3	MS. WILKINSON: Okay. Thank you, Jonathan.
4	And, finally, we will hear from Sally
5	Hubbard, a senior editor with the Capitol Forum where
6	she covers monopolization issues and data regulation in
7	high-technology markets. Previously, Sally served as
8	an Assistant Attorney General in the New York State
9	Attorney General's Antitrust Bureau
10	MS. HUBBARD: Thank you to the FTC for having
11	me here today. And I want to give the standard
12	disclaimer that I am sharing my own views and not the
13	views of my employer.
14	I want to echo actually a lot of what
15	Jonathan just shared. Since this panel is about
16	enforcement levels, I can sympathize with enforcers
17	since I was an Assistant Attorney General. The
18	litigation realities for challenging these types of
19	mergers are pretty harsh. My view is that current
20	antitrust doctrine is really missing the forest for the
21	trees. And I do not think this is an accident. I
22	think it is as a result of a decades long campaign by
23	Chicago School economics and corporate defendants to
24	really weaken the antitrust laws. So this is the
25	reality that enforcers are facing.

1	And in recent years, though, however, I have
2	been able to step back from those harsh litigation
3	realities as a writer focusing exclusively on Google,
4	Apple, Facebook, Amazon and antitrust. What I have
5	gotten to do is have the luxury of looking at the big
6	picture. I get to look at the forest, and what I am
7	seeing is really more like a cleared Amazon Rainforest
8	than a healthy competitive landscape.
9	As Diana mentioned, there has been hundreds
10	of acquisitions by the big tech platforms. I am
11	talking about Google, Apple, Facebook, Amazon.
12	Hundreds of acquisitions, billions of dollars' worth of
13	deals, and many of those deals have allowed these firms
14	to maintain their monopoly power, extend their monopoly
15	power or eliminate competitive threats.
16	So when enforcers are looking at tech
17	platform acquisitions, they should not get distracted
18	by promises of short-term consumer welfare enhancements
19	because what benefits consumers is competition. A
20	short-term product improvement that is labeled
21	"procompetitive" does not justify the elimination of a
22	competitive threat. After all, Section 7 of the
23	Clayton Act "prohibits mergers and acquisitions where
24	the effect may be substantially to lessen competition
25	or to tend to create a monopoly."

1	The Clayton Act does not qualify this
2	prohibition by saying unless the merger creates
3	efficiencies, or unless the merger leads to low prices
4	in the near term, or unless the merger allows an
5	entrepreneur to exit competition.
6	And let's not forget the second part of
7	Section 7. It prohibits acquisitions where the effect
8	may be to tend to create a monopoly. This means, as
9	others have pointed out, that enforcers should
10	scrutinize acquisitions by dominant platforms more
11	heavily than acquisitions by firms that lack market
12	power. But as you have heard on some of these panels,
13	our familiar metrics that we like to rely on as
14	antitrust enforcers are not really that reliable,
15	right? Prices, market shares, market definitions,
16	markets are very fluid. Those handy tools that we are
17	used to relying on can fail us when we are looking at
18	

**266** 10/17/2018

enforcers astray because the biggest competitive threat
to platform incumbents are likely to come from firms
that are in seemingly different product markets
altogether. Why is that? Well, because startups that
want to challenge tech giants and their core
competencies cannot actually get funded.
So if our typical proxies are not much help,
enforcers should be able to show competitive effects
directly. They should not have to prove the
second-best proxies. And this is what the horizontal
merger guidelines already say. But often courts do not
go along with this.
So where do we go from here? I see about
four main options for enforcers. The first is to bring
hard cases and try to change the legal doctrine and the
current standards. You got to pick the ones that have
the best facts, but you also have to know there is a
good chance you are going to lose. And if Congress
agrees with you and disagrees with the courts, that
could help spur option number two, which is a
legislative fix.
There have been some proposals like the
Klobuchar Bill. The odds of any of these things
passing is a question, especially as these tech giants
keep increasing their lobbying budgets.

**268** 10/17/2018

concerned about false positives or false negatives when
making enforcement decisions regarding nascent
acquisitions in digital markets? And are there
particular cases where you believe the antitrust
agencies either went too far or did not go far enough
in their enforcement efforts?
And for such cases, I would be interested in
hearing feedback that could be instructive for future
investigations, such as whether there is an alternative
analytical framework that you believe the agencies
should have used to evaluate these acquisitions or
whether there are facts that the agencies may have
missed that were reasonably available at the time of
the acquisition and, if known, might have resulted in a
different outcome.
I'll open that up to the panel.
MS. MOSS: Do we volunteer?
MS. WILKINSON: Sure. Diana, going first.
MS. MOSS: Okay, thank you. So very good
question. I have just a couple remarks on this. One
is, frankly, it is difficult to say whether we should
be concerned about false positives or false negatives
for two reasons. One is we have had relatively little
enforcement in the digital market spaces. So when you
do not have any observations to work with, it is kind

1	of hard to tee up those counter-factuals.
2	Second, we do not have the benefit, as we do
3	in nondigital markets, of a lot of merger
4	retrospectives. So we have now heard all day long how
5	valuable merger retrospectives are. And, of course, we
6	are dealing with a lot of data and evidence mainly
7	through the work of John Kwoka and all the scholars who
8	have produced individual retrospectives that really
9	support the notion that we should not be so concerned
10	about false positives; that four-to-three mergers, for
11	example, are almost incredibly surely to be damaging
12	and that enforcement actually supports higher levels of
13	challenges in cases of four-to-three mergers.
14	We are just not there. You know, we are in a
15	warp. We are in a time warp here because enforcement
16	in digital markets is really just evolving at this
17	point and we have not done retrospectives. We can talk
18	later about what those retrospectives might look like.
19	My second point on this particular question
20	is you know, is the framework correct? Is the
21	enforcement level correct? Well, you know, I think the
22	way you think about the framework is in the digital
23	market spaces, much like in nondigital market spaces,
24	you are talking about three fundamental types of
25	consolidation. One is horizontal mergers. For example

25 consolidation. One is horizontal mergers. For example

1	Google-Softcard, Facebook-Instagram. You are talking
2	about vertical mergers that combine firms in adjacent
3	markets. That would be in Google-ITA, that was online
4	travel and back-end travel software; Apple-Shazam, that
5	was music identification technology and music digital
6	procurement technology. But we are also talking about
7	conglomerate mergers in the digital market spaces.
8	I think this is the big one. It is that
9	antitrust has never done well with conglomerate
10	mergers. It rarely does very well with vertical
11	mergers, cite CVS-Aetna, and look at our press release
12	on the AAI website.
13	Horizontal mergers, it does pretty well
14	looking at overlaps and the elimination of head-to-head
15	competition. We have lots of tools to help that
16	analysis along. But it really sort of deteriorates
17	from there. Vertical is a challenge. If vertical is a
18	challenge, conglomerate is going to be an enormous
19	challenge.
20	So mergers like Microsoft-LinkedIn, I would
21	put in the conglomerate merger space. You can argue
22	with me on that. Facebook-Face.com, that was social
23	networking and facial recognition. Google-DoubleClick
24	combined ad serving through pay-to-click and ad serving
25	through banner and exchange ads. These are all mergers

1	that fill that occur in more broadly defined
2	markets. And that is very much in keeping with the
3	digital platforms because it is all about linked
4	services and products, connectivity, and the
5	development of value-added services to users and
6	consumers.
7	Antitrust does not think well that way. It
8	is all about transactions. It is all about buyers and
9	sellers and suppliers and distributors. So we really
10	do need a different frame of reference.
11	And when we get to the conglomerate mergers
12	and talk more specifically about competitive effects, I
13	think we have even more problems there.
14	MR. YUN: Can I weigh in?
15	MS. WILKINSON: John?
16	MR. YUN: So I have heard a lot about
17	retrospectives and I agree you have to be for
18	retrospectives. If you are not for retrospectives,
19	something is wrong with you I guess. So I am for it.
20	But if you are actually going to do it, how
21	do we do it and what does it look like? So let's get
22	in our time machine, our back to the future time flux
23	capacitor, hot tub time machine, whatever you want to
24	get in, and go back to April 9, 2012, when Facebook
25	bought Instagram. Instagram, at that time, had 50

- 1 million people. What would we expect for that to be ex
- 2 ante -- looking ex ante to be ex post as sort of an
- 3 okay merger? That Instagram would have puttered along
- 4 to what it was, 50, grown at an historic rate,
- 5 integrated into Facebook to some degree. And we are
- 6 like, okay, that was a good merger. It did not seem
- 7 like it was that important a -- or they discontinued,
- 8 after a few years, Google Plus Style, and it was just
- 9 like, oh, it did not really go anywhere. I guess it
- 10 was not important again. Or it gets very successful.
- 11 It becomes ones.0001 Tc (million people. W11)3etfIPlus Style, and it wasp7s1g k4ets

1	three, which is a compound percentage of 12.5 percent
2	of success in a market. There are a lot of hurdles
3	these younger firms have to overcome and there is some
4	probability they fail and probability they succeed.
5	What if they increased it 20 percent, 30
6	percent, 40 percent? That compound probability
7	doubles, triples. And so is that an efficiency we
8	recognize? Would that, in a retrospective, be
9	something we credit the agencies for getting right?
10	And those are just the questions I have and I
11	am not asserting Facebook-Instagram is the model of a
12	procompetitive potential acquisition or it is
13	anticompetitive. It is just I think there are some
14	difficulties in really coming up with the right
15	counter-factuals when there has been exponential
16	growth. So that is sort of something I wanted to throw
17	out there.
18	MS. WILKINSON: Sally?
19	MS. HUBBARD: The Facebook-Instagram merger
20	is one of the ones that I think is kind of the biggest
21	mistakes to have let through. One of the warning signs
22	that there was, that could be a little bit of a red
23	flag to look out for in the future is that Facebook was
24	paying \$1 billion for Instagram at that point.
25	Instagram had no revenue and they had 50 million users.

1	What did Facebook see that it was worth a billion
2	dollars to them? So that is a red flag to look out
3	for.
4	And then what has been the impact of this
5	going forward? I have written about how I think a lot
6	of the fake news and privacy problems that we are
7	having with Facebook right now are related to the fact
8	that it is a monopoly. It does not have the pressures
9	of competition to discipline it. I think competition
10	and the economy keeps firms on their best behavior,
11	either that or regulation, right? I prefer
12	competition.
13	I know after the Cambridge Analytica scandal
14	a lot of my friends said, oh, well, I am quitting
15	Facebook, but I am still on Instagram. They did not
16	even realize that you know, they did not have a
17	choice. They did not have a way to vote with their
18	feet and say, no, it is not okay for you to give our
19	data away without our permission.
20	So I think and another thing is that
21	Facebook basically has Instagram as its fall-back Plan
22	B. It is really behaving in an irrational way, letting
23	its brand reputation go so downhill with the way it is
24	really not fixing the problems. But it knows it has a
25	Plan B, which is Instagram.

**276** 10/17/2018

1	not apply to a multidimensional, three-dimensional age.
2	And I think sometimes the problem with the
3	law focusing so much on economic theory is it gets
4	anchored in theories that are kind of stayed. Those
5	kinds of distinctions, as being the anchors for how we
6	evaluate these kinds of problems, tend to throw us off
7	and away from the issues that really matter. And so I
8	think we have to figure out better ways to look at the
9	dynamic nature of competition.
10	And when I think about it, you know, people
11	often talk about Schumpeter and so long as, you know,
12	the next thing is on the horizon, everything is going
13	to be fine, but the issue on platforms is that the next
14	thing on the horizon is often this new nascent threat
15	that comes on the platform. And so you have to make
16	sure that there is enough room on the platform for
17	these new threats to emerge and to breathe.
18	And you know, I am sympathetic to what John
19	was saying. I mean, these are hard issues. How do you
20	figure out which deals to block and which ones not to
21	block, when to take action and when not to? And I get
22	that, it is hard. But I think the paralysis due to
23	concern about false positives has resulted in perhaps
24	an overcompensation to the point where maybe we are not
25	addressing problems that need to get addressed because

1	we are so dependent on defending our tools that we are
2	not spending enough time rethinking them.
3	MS. WILKINSON: Okay. Thank you. Danny?
4	MR. SOKOL: Some very quick points. So
5	sometimes we have merger retrospectives, we call them
6	academic empirical work. The problem is a lot of times
7	we all look narrowly at the lowa economics literature.
8	There are not as many of these studies as we would
9	like, but, in fact, they do exist, in finance and
10	information systems, in marketing, strategic management
11	and operations management.
12	And specifically to the point of
13	Facebook-Instagram, you know, we have that. It is
14	called an A publication to get you tenured at any of
15	the schools where we had business school professors
16	earlier, Steve, Judy, Robin, Bill. That was in
17	management science. Li and Agarwal's 2017 paper,
18	Platform integration and demand spillovers in
19	complementary markets: Evidence from Facebook's
20	integration of Instagram. And, in fact, what they find
21	is that the deal was procompetitive and it actually
22	also helped the larger of the third-party complementary
23	app developers. So I think we can put that one to
24	rest.
25	Broadly, I would say merger retrospectives

1	are helpful in a different way. It helps frame a
2	broader political debate, something John raised
3	earlier. So I think one problem that the agencies have
4	had here relative to other oh, this is the first
5	time I have ever been told I need to speak into a
6	microphone. Normally, my voice carries.
7	So the other thing is relative to, say, DG
8	Competition, I think the U.S. agencies do a less good
9	job in this particular area. And that is in mergers,
10	in deals that they allow to go through, they do not
11	give the kind of detailed commentary, particularly for
12	high-profile deals, particularly for platform deals
13	that we have seen DG Comp do. And I think that this
14	goes to some of the political questions that get asked
15	because people are frustrated because the agency simply
16	is not sharing its knowledge I think as effectively as
17	it could. It is a different form of storytelling, but
18	I think one that is highly important.
19	The other thing is I want to put in a plug
20	for the work of AAI because AAI really has tried to
21	think interdisciplinary-wise, along a number of
22	different areas to sort of think what do we know and
23	how can we sort of bring in tools from different
24	disciplines to help tell a more nuanced story. So just

a little plug there.

**280** 10/17/2018

1	idea. And sort of on its face, that is a reasonable
	,
2	enough conjecture and hypotheses, and I think that is a
3	good way of looking at it.
4	Potential competition is I like to think
5	of it actual versus potential entry. Actual entry, we
6	know it is a competitor today and it is competing and
7	it affects price. Potential competition, as I perceive
8	it and I know others use it a bit differently but
9	I think generally as a guideline, this is in sentence
10	one of the merger guidelines. We hear it a lot. Oh,
11	we need more stuff happening in FTC. Sentence one,
12	"Guidelines outline the principal analytical
13	techniques, practices, and the enforcement policies of
14	the DOJ and FTC with respect to mergers and
15	acquisitions involving actual or potential competitors.
16	So there the relevant market is the
17	relevant market. It is just they are not in today, but
18	there is some projection, whether it is tomorrow or two
19	years or three years, that they will be in the future.
20	Now within potential competition, there are
21	further delineations. What is it? It is actual
22	potential competition and that's how I would think
23	of it is just an entrant that has not come in yet but
24	could.

25 Then there is the perceived potential

1	competition where there is not really an entry story,
2	it is just their presence constrains prices today so
3	they are a competitive influence. And then there is
4	potential potential competition, which is the
5	Nielsen-Arbitron, which I like to think of as a
6	potential entrant in a potential market. I think that
7	maybe is a little helpful. Or future market. I think
8	that is more fun, future. So those are the
9	terminologies.
10	So if we do those right, I do not really
11	think we need to go in broader stuff because when we go
12	broad and I think others have probably picked up on
13	this we have to be careful. If you are saying,
14	well, Instagram was a competitor and it was not a
15	nascent competitor, but it was sort of a competitor in
16	a differentiated space, then you are expanding the
17	market.
18	Well, some people would say, no, you do not
19	have to do that, you can sort of in a nonlinear say
20	they were unique. I think you are getting into very ad
21	hoc, dangerous sort of use of antitrust, using the
22	words of antitrust, but you are really sort of
23	gerrymandering the market at that point.
24	So long story short, definitions are
25	important, but I think within each structure you can

1	work within the existing framework.
2	MS. WILKINSON: Okay, good.
3	MR. KANTER: Yes, I think I agree with John.
4	I think the U.S. vs. Microsoft framing of nascent
5	competition is the right way to think about this. I
6	mean, there certainly are important questions about
7	whether product A is a substitute for product B and
8	whether they are existing or potential competitors.
9	And I think that is something that the agencies will
10	look at and, you know, have traditionally looked at.
11	But when you are dealing with, you know,
12	platform technologies, more often than not these
13	technologies have very strong feedback effects. They
14	have they are winner-take-all or winner-take-most.
15	And the threat, the platform threat is likely to come
16	from disruptive technologies, things that get in the
17	way of that feedback loop. And that is, you know, that
18	is really where the nascent threat was the case in the
19	U.S. vs. Microsoft because in Microsoft in terms of the
20	applications barrier to entry.
21	And if you are thinking about acquisitions or
22	if you are thinking about Section 2 cases and you are
23	looking at nascent threats, it is really important to
24	see it in the context of that feedback loop and
25	understanding the realities of the way the market

1	functions. That is hard to do. And I think sometimes
2	one of the challenges we have is that we are trying to
3	fit things into market definition boxes like sort of
4	the question, you know, would suggest. I think that
5	often leads to kind of missing the mark in terms of
6	where these issues really lie.
7	MS. WILKINSON: Diana?
8	MS. MOSS: Stephanie, can I just add, I mean,
9	this is a good discussion for sure, but on the market
10	definition issue, I think it is important to add that
11	market definition should not be the step one in the
12	merger analysis process.
13	So if you go back to the merger guidelines,
14	we have heard a lot about the guidelines. I would hope
15	and think and expect that the agencies, given how
16	experienced they are, would be looking to things like
17	direct evidence first when presented with a new
18	acquisition involving a nascent competitor. There have
19	been enough acquisitions as I cited to earlier. There
20	is water under the bridge. There should be lots of
21	observations in terms of which deals have eliminated
22	head-to-head competitors, which deals where do we
23	have natural experiments, for example, to see what
24	happened to entry, after an acquisition and even exit.
25	So direct evidence should play a heavy, heavy role

- 1 here.
- 2 And then I would offer up that the agencies,
- 3 as they usually do, will have a good theory of harm
- 4 going into a case before they even get to market
- 5 definition, right, whether that theory of harm is

1	products competing with each other and horizontal
2	plays, we might have differentiated platform offerings
3	over on the digital market side.
4	These are relatively easily translatable
5	concepts, which brings us to market definition which
6	could include any number of relatively narrow markets
7	but also broader ecosystem-type relevant markets that I
8	really genuinely think there could be made a case for
9	that. So simple markets like data, cloud services,
10	connectivity services, content and advertising, those
11	are simply defined markets depending on the theory of
12	harm. But antitrust, I think, has to widen the lens to
13	think about these broader markets that might include
14	connected services not just in adjacent markets, but in
15	related markets that very much are endemic to the
16	platforms and how they create value added for their
17	users.
18	MS. HUBBARD: Yes, I would just like to
19	second what Diana said about really focusing on the
20	theory of harm. And I think that is really even more
21	important with tech platforms because it is not going
22	to be so obvious where the harm might be as the markets
23	are fluid. And looking at the competitive effects
24	first instead of just saying, okay, this is a market
25	as we see it, you know, Facebook is a social network,

- 1 Instagram is a photo-sharing app, even though really 2 what everybody did on Facebook was share photos, but it takes just a deeper dive into the competitive effects 3 analysis and the theory of harm before kind of jumping 4 5 to a conclusion about what the relevant product market 6 is. 7 And the markets are fluid, too. I mean, they 8
- 10/17/2018

- 1 be applied in the setting that we have seen before.
- 2 And, oh, by the way, let's be careful for how we define
- 3 markets, right, if we do not define them narrowly
- 4 enough, we are going to lose.
- 5 I am going to actually go back to something
- 6 that Paul Denis raised earlier, which is the 1982
- 7 California Law Review Symposium. I would actually
- 8

- model for how competition works and take the realities
  of these complex markets and put them into those models
  for how competition works, they are not going to match
- 4 up.
- 5 And so some of the discussion is, well, how
- 6 do we modernize that? How do we look at -- you know,
- 7

## 1 specifically. I think we will do a lot better. 2 MR. KANTER: Economics is pretty broad, 3 though, right. So why wouldn't you have the same 4 approach when it comes to economists and economics? 5 MR. YUN: Well, IO is broad, but it is 6 reasonably cabined within a certain area. Economics is 7 broad and you can bring economic historians on -- we 8 have in the past -- but they still are guided by basic 9 IO principles of the guidelines and how we assess 10 mergers. You learn your trade. 11 MS. WILKINSON: One minute. 12 MR. SOKOL: Since I had the slide on tech. I 13 will just throw in one thing. I think that the 14 advantage of having something within an agency is that 15 you create institutional memory and I think that that 16 is really important. 17 MS. WILKINSON: Okay. Thanks. 18 Moving on from product market now, I would 19 like to focus on what kinds of competitive effects and 20 entry barriers should we be most concerned about when 21 evaluating nascent acquisitions in digital markets, 22 especially considering that many of these markets are 23 considered zero price? Conversely, what kind of unique 24 benefits and efficiencies should we credit when

25 evaluating these acquisitions?

1	MS. MOSS: Thanks, Stephanie. I will stab at
2	this one. But I want to take my time, limited time, to
3	really talk about one particular play. Acquisitions of
4	nascent competitors can occur in all sorts of different
5	plays. It can be sort of off the platform, like a
6	Facebook-Instagram kind of thing, or it can be to the
7	side of the platform or it can be right on the
8	platform.
9	So I want to focus just briefly on a class of
10	transactions or players that involve acquisitions where
11	the platform is very much involved, where the platform
12	controls critical access to data, for example, to
133	

1 create a whole new platform, but that is the business 2 model for these types of rivals. So entry is really 3 not the issue. They are trying to get access to a 4 platform which controls lots of functionality and is 5 really the lifeline and the channel and conduit to the 6 ultimate consumer. 7 So, you know, that is the kind of thing for 8 which we actually have lots of history and models and 9 data points on conduct. I mean, I know this sounds 10 silly, but I am a former federal regulator and some of 11 my biggest projects in the earlier part of my career 12 were developing opening access rules for electric 13 utility systems, right, where you had a vertically 14 integrated transmission owner and you wanted a small 15 generator, an independent generator wanted to get on 16 the system. They had to get access to transmission. 17 They had to wield their power through the system. 18 I mean, that is a general model that 19 antitrust and regulation has dealt with. Antitrust 20 should deal with it by getting the antitrust laws right 21 without having to turn to regulatory types of concepts. 22 But the competitive effects that we worry about with 23 that particular play are things like a platform 24 potentially changing the rules of the game, hindering

25 or hampering potentially interoperability, changing

- 1 algorithms to make it more difficult to interoperate on
- 2 the platform.

3	I think this concept of having your own
4	private label as a platform is we heard this earlier
5	in the day a really important concept. Think about
6	shelf space in a grocery store where Safeway has its
7	own private label. You have a big food manufacturer,
8	who is the category captain, controlling shelf
9	placement for that particular group of products or
10	services. It is a similar concept, right. It looks
11	like brand competition, but it is really not. It is an
12	illusion of competition, especially when the platform
13	acquires a smaller nascent competitor.
14	So, you know, we want to talk about data
15	sharing, for example, the use of data, critical access,
16	critical input. Data is a really important input, a
17	strategic asset, to control that, to shape or to
18	control competition in those spaces. So this
19	particular play, I think, is very important to think
20	

1	confused about what you are talking about because I
2	know I have actually spent the last couple years just
3	documenting these instances where the tech platforms
4	are kind of burying and denying access as the problem
5	you are identifying, this access problem.
6	MS. MOSS: Right.
7	MS. HUBBARD: Basically denying like I
8	say, they are controlling the game they are
9	controlling the arena in which the game is played and
10	they are also playing the game themselves. So they can
11	be the platform, be playing on the platform, and then
12	bury anyone else who also tries to play on the platform
13	against them, like bury their vertical rivals on the
14	platform. You know, like Amazon putting its basic
15	product at the top of the search results or Google
16	putting its shopping products on the top of the search
17	results.
18	But I have not seen many, like, acquisitions.
19	Is there an example? I mean, I see this all the time,
20	this burying, this denying of access to competitors.
21	MS. MOSS: Right.
22	MS. HUBBARD: But I just have not seen any
23	acquisitions.
24	MS MOSS: Well I 0 al8g

1	MS. MOSS: No, it is a good question, Sally.
2	So, you know, for example, Google's acquisition of Waze
3	was an acquisition of a smaller rival where Google had
4	that own capability, that own functionality itself. We
5	could find examples in Amazon. For example, Amazon is
6	pushing into drug distribution. That may be
7	efficiency-enhancing given the problems we are seeing
8	in the drug distribution markets and the PBMs. But
9	they are acquiring PillPack, which is going to be a
10	source of important input.
11	So these types of acquisitions where the
12	platform has their own private label and then there is
13	a nascent competitor and then that nascent competitor
14	is absorbed by the platform, you know, the question is,
15	well, how does that affect competition, how does it
16	affect consumers, right?
17	And, you know, my argument would be we need
18	to be focusing much more on innovation theories of
19	harm. I heard someone say here earlier that innovation
20	theories of harm are dead. They should not be dead;

1	of barriers to entry. But I think we should really
2	view it as to how the participants in an industry use
3	data in a market and is this a scarce good and are
4	entrants really in need of this and is it they
5	cannot obtain it what is the history of the market?
6	So for example, you look at something like
7	search engines, something like Google. It is
8	inevitably going to be brought up that Google and
9	Facebook have big data and that sort of creates
10	and enforces their market power. And then the question
11	is, how is data being used? Is it just the existence
12	of data or is it part of a larger production function
13	along with other inputs? And those inputs are maybe
14	maybe big data is a big part of it, but those other
15	inputs are as well, including the algorithm, the
16	quality of the employees and the other technologies
17	that evolve around that data.
18	Certainly, data is important and you need it,
19	but there is a real question of how much you need it.
20	For example, the nascent competitive threat story, if
21	you need big data to be competitive, why are we ever
22	talking about nascent competitive threats? They would
23	never be a threat; they would never have big data.
24	They are all nascent, they are small. How could they
25	grow up to be competitive?

1	I reject that. I think we all would reject
2	that story. So I think we have to be consistent and
3	reject the story that big data, in and of itself,
4	insulates big firms from competition. And I think
5	history has shown and I will not go through the
6	boring examples that everyone brings out of MySpace and
7	Friendster, which no one uses anymore, and then but
8	iTunes and Spotify, a more recent example.
9	MR. SOKOL: How about Tinder? No, I am going
10	to throw this out there. It is late in the afternoon
11	and I have tenure and I can go there.
12	(Laughter.)

1	the following: There were plenty of dating websites
2	before that. They had tons of data. But do you know
3	what they didn't have, a great idea, which is
4	apparently, from what I understand from my students, it
5	is not dating as I would imagine, it is dating in
6	quotes. But this idea was a binary, do I like them, do
7	I not like them? One is them is left; the other one is
8	right swipe. I do not know which one and I do not want
9	to know.
10	The point is, all of a sudden, it did not
11	matter that Match.com and eHarmony and all these sites
12	had tons of data, they did not have that breakthrough
13	idea. Tinder did.
14	MS. MOSS: Stephanie, can since we are all
15	in example mode here and it is you know, case
16	studies are wonderful, especially in this particular
17	conversation. But I would offer, to give Sally even
18	more examples, you know, would be Apple-Shazam. So,
19	you know, the Europeans just took a look at
20	Apple-Shazam and, you know, I would submit that the
21	Europeans took a very narrow market definition. This
22	goes to my earlier moment about not focusing the lens
23	

1	interconnected, interlinked products and services.
2	That can be defined as a relevant market.
3	You need a good, powerful, clear theory of
4	harm to back that up if you go down that road, but it
5	is entirely possible. But the Europeans took a very
6	narrow lens on Apple-Shazam. It was a theory of
7	foreclosure that by acquiring Shazam, which is music
8	identification paired up with digital music
9	procurement, that they would have access to data that
10	would allow Apple to target customers to steer them
11	away to steer them towards getting the tune,
12	actually purchasing the tune on iTunes, and away from
13	rival, Spotify, for example. Well, lo and behold,
14	Spotify apparently never complained about this. So
15	there has been this real robust debate about why that
16	did not happen, why there was no complaining from
17	Spotify.
18	But that is an example of sort of a narrow
19	lens around a relevant market, a well crafted theory of
20	harm, vertical foreclosure, cannot complain about that.
21	But how could that lens have been broadened in a way to
22	capture more than just data markets but also capture
23	sort of the end user experience and choice and under a
24	consumer welfare standard?
25	MS. WILKINSON: Okay. I am going to move on

1	now unless anybody has anything else to say on this
2	topic.
3	MR. SOKOL: Very, very quick.
4	MS. WILKINSON: Okay.
5	MR. SOKOL: So as we look at each particular
6	case, we should also look to see what is sort of the
7	prior history of the companies. So sometimes when
8	companies make acquisitions, they leave the targets as
9	separate subsidiaries and they do not really mess with
10	them. And that, I think, looks very different than a
11	full integration. And sometimes full integration works
12	and sometimes it does not work, and these are all
13	things that agencies should consider.
14	MS. WILKINSON: Okay.
15	So moving on, a key issue for the agencies,
16	when thinking about these cases, is determining when a
17	nascent technology is likely to develop into a
18	significant competitive threat such that we might have
19	concerns if it were acquired by an established
20	

**304** 10/17/2018

1	and I think this goes back to the comments from
2	Chairman Pitofsky we do need to be more sensitive in
3	certain markets that involve speech, that involve
4	marketplace of ideas, that involve information that is
5	vital to our functioning democracy. Those markets are
6	really important just as courts, including the Supreme
7	Court have given them heightened levels of scrutiny and
8	importance, so too should the antitrust laws.
9	MS. WILKINSON: Sally?
10	MS. HUBBARD: So some similar points that I
11	wanted to make, which are just kind of some questions
12	to be exploring, you know, how will the acquisition
13	help a tech platform either obtain monopoly power or
14	maintain its existing monopoly power and could the
15	platform get access to new types of data that will
16	fortify its existing monopoly power? So it is not just
17	all data, big data; it is about unique data. And I
18	think that, you know, there is qualitative aspects of
19	data that we need to be considering.
20	How could the acquisition help a tech
21	platform leverage its monopoly power into a new market?
22	How could the acquisition exclude competition through
23	vertical integration tight vertical integration or
24	foreclosure of access to APIs? And maybe that is a
25	type of merger condition that could be used more often,

- 1 it is just a very thorough process and I would like to
- 2 defend the agencies in that respect and I think they
- 3 are getting it right.
  - (Applause.)

4

- 5 MR. KANTER: Let me -- and that was Scott
- 6 Sher there clapping for the record. Hi, Scott.
  - You know, I agree. Listen, I have great
- 8 respect for the agencies and the work that they do and
- 9 having been on the receiving end of many second
- 10 requests, they are indeed very painful and invasive and
- 11 the agencies put a lot of effort into turning over
- 12 stones. So this is not, in any way, an indictment of
- 13 the work of the tremendous professionals.

to

1 rule here.

2	So I think on one hand we do look at a lot of
3	information, we do look at a lot of data. On the other
4	hand, you know, sometimes we do not always know what
5	do with it in the context of the way these markets work
6	and, you know, we maybe can do better in terms of
7	understanding the realities and the way these
8	marketplace work so that we can appreciate the
9	significance of the data and so that we can appreciate
10	the significance of the massive amount of information
11	that the agencies are considering as part of a
10	

1	You know, there is a fact pattern there that
2	would be very useful to port over to the digital market
3	side. How were the Asians going to be competitive?
4	Well, they were going to have to get access to
5	distribution in the United States. Getting access to
6	retail distribution is really, really tough. There is
7	an analogy to that when you interoperate on a platform
8	or you are acquired by platform. You have to get
9	access to shelf space, you pay slotting fees, you have
10	to develop brand recognition and brand loyalty.
11	So all these factors go to supporting the
12	notion or a set of parameters for determining whether a
13	nascent competitor is enough of a threat. And it needs
14	to be thought out. I do not have all the answers, but
15	it is a tough, tough question, I think as we have heard
16	all day here. What I hope we do not end up doing is
17	coming up, ginning up a bunch of bright-line tests for
18	what is determinative of what is a nascent competitor
19	and their competitive impact, potential impact or
20	influence.
21	MS. WILKINSON: Okay, thank you. We have
22	about a minute and half left and I am going to give the
23	final word to Danny on this topic.
24	MR. SOKOL: Thanks. I will be very fast
25	because I do not know how to speak not fast.

1	agencies work very hard to get this right. Absolutely.
2	Now, the second part of, like, should we be thinking
3	about broader categories? We should be thinking about
4	whatever will give us better information to make better
5	decisions. I think we can all agree to that part.
6	And it is all about getting that information
7	to in very, very tough situations, can we get it
8	right? And a lot of times, it is not clear that the
9	people who make a ton of money on this can get it
10	right. So I would say let's keep expectations at a
11	realistic level.
12	MS. WILKINSON: Okay. Thank you. I think we
13	are done.
14	So, everyone, please join me in thanking our
15	panel for an excellent discussion.
16	(Applause.)
17	MS. WILKINSON: And if everyone in the
18	audience can please remain seated, I think we are going
19	to do a quick transition to the final panel of the day.
20	(End of Panel 4.)
21	
22	
23	
24	
25	

**312** 10/17/2018

1	McDermott, Will & Emery antitrust practice. And then
2	now I'm losing sight of the order here, but it's
3	Andrea Agathoklis Murino. She is with Goodwin's
4	antitrust group here in D.C., former attorney advisor
5	to Chairman Kovacic at the FTC.
6	And then Scott Sher at the very end, he heads
7	up the antitrust department at Wilson Sonsini. So a
8	tremendous group of litigators and antitrust lawyers
9	who I hope will help us shed light on some of the
10	really complex issues that we've talked about over the
11	course of the first couple of panels this afternoon.
12	Scott, to start things off, can you explain
13	to me from a practitioner's perspective what we're
14	talking about when we're talking about a nascent
15	competitor? Is that just a potential competitor, or
16	that something else?
17	MR. SHER: Sure, Mike. I don't think that
18	there's much of a difference from a practitioner's
19	perspective, but obviously there are case law
20	differentials. Potential competition is defined in
21	case law as either actual potential competitor or a
22	potential potential perceived potential competitor or a
23	potential potential competitor. And whereas I think
24	it's correct, the last panel talked about nascent
25	competitor being generally described as a company that

1	has a promising technology this was from the
2	Microsoft case that may or may not be able to bring
3	that technology to market and may or may not need
4	assistance in bringing that technology to market.
5	From a practical perspective, in most deals
6	where you're dealing with small technology companies,
7	you tend not to define them as potential competitors
8	just because you have the framework from the guidelines
9	that gives you less flexibility as to how to
10	characterize them. And more often than not we define
11	these small companies that have interesting
12	and important technology potentially as nascent
13	competitors.
14	MR. MOISEYEV: Debbie, does that make a
15	difference in how the agency or how you would analyze a
16	merger?
17	MS. FEINSTEIN: Okay, so first, it's a little
18	funny to be having Mike ask the questions rather than
19	answer them because he's thought about this more than
20	any practitioner since much of what the division does
21	is potential competition type cases in pharma and
22	elsewhere. So a couple of points.
23	You know, we all think of Section 7 as
24	requiring some degree of likelihood that it will lead
25	to problems, and so where on the spectrum you are is a

4	little upplear, and there been't been a lat of sees
1	little unclear, and there hasn't been a lot of case
2	law. We tend to use the word "nascent" when we're
3	talking about a Section 2 Mallinckrodt-type case, no
4	particular reason for that. So I agree that some of
5	the terminology gets blurred and that it's really not
6	that important to talk about the technology.
7	What you're talking about is what's the
8	status of the acquired firm. Let's call it acquired
9	firm. It could be the acquiring firm who's the new
10	technology person, but what's the status of the
11	acquired firm and what will be the affect on
12	competition if it's acquired by the entity that it's
13	being acquired from, and the labels we put on it.
14	And I think if you go and back look at the
15	complaints during the time that I was there, I'm not
16	sure we ever used the phrase "potential competition."
17	We used the phrase "future competition" because in the
18	pharma world it's not's so potential. Once somebody
19	has actually filed with the FDA, the likelihood that
20	they're actually going to come to market is
21	extraordinarily high. So we would talk about future
22	competition.
23	I will say one thing. I've never figured out
24	how one could actually ever bring a perceived potential
25	compatition case because the memory you bring it the

25 competition case because the moment you bring it, the

**316** 10/17/2018

1	greater opportunity, hopefully significant opportunity,
2	for audience participation here. So as we go along,
3	please submit any questions that you have, and we'll
4	try to take them on, time permitting, as we go through
5	this.
6	So with that said, I wanted to raise the
7	question of whether there are any special attributes of
8	high-technology markets that affect merger analysis.
9	We've spent a lot of time over the course of the last
10	few days talking about platform competition, and some
11	of the attributes of high-technology markets are
12	certainly focusing on mergers.
13	Andrea, can you shed some light on that
14	question?
15	MS. MURINO: Sure, I'm happy to. And I just
16	wanted to thank Mike and everyone in OPP for organizing
17	and for having me here today. I agree with what Debbie
18	said, that the purpose here is really all about getting
19	to what the competitive impact is. But I think
20	fundamental to that is understanding that there are
21	some differences when you're looking at certain kinds
22	of high-tech deals.
23	And the one word that always pops into my
24	mind is speed. And the pace of play here is just
25	different than it is in other industries. And I think

1	that has a very meaningful effect on the way that the
2	agency has to go about gathering the facts and
3	assessing the evidence. These markets can be very
4	fickle. These markets are capable of being appended
5	quite quickly, and because of that, some of the data
6	that we provide to the agency, to the DOJ as well, by
7	the time you provide it, it's already old, time has
8	already passed.
9	And so when I'm working on behalf of clients
10	trying to explain competitive dynamics, I find that
11	that's one area where you have to really make sure
12	everybody is on the same page. If there is not an
13	appreciation that things can change on a dime, you're
14	not really able to look at the nuts and bolts of the
15	

For The Record, Inc. (301) 870-8025 - www.ftrinc.net - (800) 921-5555

- 1 throughout your hearings, your concern is innovation.
- 2 So going back to what Paul Denis was teaching us
- 3 earlier, you have to ask a bunch of questions, you
- 4 know, how serious, how substantial is this particular
- 5 nascent competitor. If they're unique, if they're
- 6 special, that's one thing. If they're one of a
- 7 handful, then the loss of that one is not such a
- 8 factor.

- Your question talked about the evolving
- 10 nature of the market. From looking back at all the
- 11 cases that have been investigated to my knowledge over
- 12 the last ten years, the dynamism of high-tech is very,
- 13 very important. And we've seen ma94 0 0 11.94 115.2 396.-c 0 2nvemak4 115.2 441.2

1	MS. MURINO: Yeah, so I don't recall exactly
2	how you phrased that. I don't think it's an issue of
3	that the agencies aren't capable of understanding.
4	I think this is really hard to do. And I think that
5	what is very meaningful and what is very helpful is
6	being able to talk to business people. That's probably
7	the number one thing I would say that is a little bit
8	different from some of the more brick-and-mortar
9	industries where you have companies that have spent a
10	lot of time developing strategic plans, they have
11	full-blown corporate development units that think about
12	corporate strategy for the long term.
13	Here, you know, some of the folks that I work
14	with, there's just one guy that has an idea and he
15	doesn't write anything down. So from my perspective
16	it's a challenge sometimes to get the agency to really
17	want to listen to that one guy's vision because the
18	agency immediately assumes that it's just self-serving
19	and that they're just saying whatever needs to be said
20	to try and get the deal through.
21	And I think that that's not always the case.
22	I think that a lot of times, because these markets move
23	so fast, because things change so fast, you really do
24	have people who are the key intellectual asset that
25	will tell you what the future is going to look like.

That's one category of information I would encourage
the FTC to more willingly embrace.
It's when I bring in that guy or that woman
that is going to be able to explain to you what they're
thinking and what they have in mind, it's not because
I've spent hours prepping him or her trying to tell
them all the buzzwords. It really is because this is
the person that has all the information in his head.
Now, that said, there are lots of documents
that are around. I mean, Scott and I were involved
in Bazaarvoice. And everyone will remember what those
documents looked like. We were just talking about that
with David. But I think that, you know, looking for
the traditional asks are also perfectly appropriate.
I also like some of the ideas that came from
the earlier panel with John Newman and Lina Khan. Lina
mentioned usage level of rival apps. I'm not sure that
that's a level of data that people really think about
when you get into certain kinds of deals, but that
could be meaningful.
And I like John's suggestion for A/B testing.
Now, all that data does come in in certain deals, and
I've seen it at the DOJ, I've seen it at the FTC. I
think what would be helpful is for the FTC perhaps to
develop a more standard ask of some of these high-tech

1	deals and say, okay, if you're doing a pharma deal,
2	when Mergers I sends a voluntary access letter, we know
3	exactly what they're going to ask for before they send
4	it. They're experts. They have signaled to the
5	market, to people like my clients, what they're going
6	to want to know.
7	I don't think we've had the same force of
8	messaging when it comes to some of these high-tech
9	deals. So I think that maybe coming up, spending more
10	time revising what the voluntary access letter would
11	look like in a high-tech deal, to include some of these
12	more odd requests, would be something that could be
13	useful.
14	MR. MOISEYEV: So speaking of that, we've had
15	actually some remarkably spirited debate about whether
16	the FTC should have on staff technologists or
17	technology experts, either embedded in the Bureau of
18	Economics nobody wanted them embedded in the Bureau
19	of Competition, which I think is sort of remarkable,
20	but or a standalone group.
21	What do you think maybe, Andrea, if I can
22	stay with you for a second can you tell me what your
23	thoughts are on that?
24	MS. MURINO: Yeah, I think it's a good idea,
25	and I'm not quite sure where some of the hesitancy

1

2 just use Mergers I since Mike is up here, you know, we 3 all know they're pharma experts, and they are really 4 good. That staff is really good at pattern 5 recognition. You don't have to explain certain 6 fundamentals of the industry to them because this is 7 all they do day in and day out. 8 I think having a tech team at the FTC perhaps 9 modeled, perhaps not, after what the DOJ has in their 10 -- I guess they call it Technology and Financial 11 Services now, what was Net Tech. But I think that 12 that's a good idea. I think that anytime you have 13 people who get exposure to the same issues again and 14 again, they become faster, they become more able to 15 analyze things more quickly. I think it becomes just a 16 more efficient work stream. So I think that would be 17 valuable. 18 I had never thought about Danny's idea of 19 hosting them in BE, but I think that's something to be 20 explored, for sure. And I certainly would, you know, I 21 think appreciate the value of the specializations. 22 People ask me all the time, can you look at my will,

comes from because I think if you look at -- again I'll

1

2 quess. 3 The way the agency deals with that is to talk 4 to anybody it can, and it does. That's one of the 5 great privileges of being in the Government is you pick 6 up the phone and, for the most part, people talk to 7 you. Professors will talk to you. Experts will talk 8 to you. You can get most of the information for free, 9 although if you really need to hire an expert because 10 you want them to testify to something or to consult 11 with you on something, there is a budget for that as 12 well. 13 But I think the number of technologists that 14 you would need to make a difference, to have somebody 15 for each of the technology areas that the Government 16 would look at and the fact that you may go six months

going on might just, on the margin, diminish, is a

17 without a case in that technology area coming up, so

18 what would that person do? I really just don't think

19 it's the most effective use of resources.

To the extent that somebody thinks that there is information out there that the agency isn't getting and the kind of person and where they should get it from, that's something to talk about, and it would be interesting. I haven't heard somebody say, oh, you know, in this investigation, the FTC missed talking to

1

2

3

4

5

6

7

8

9

10

these kind of people at these kinds of companies and,		
therefore, they missed that the future was here and		
they thought the future was there. I just haven't		
heard that kind of criticism.		
So I'm with John on this one that I don't		
think that's the most effective way, if there is an		
information gap to fill it.		
MR. PARKER: You know, I have an opinion, and		
that is I was Bureau Director when they started the		
patent group, and I think that was a big success. And		

11 these were lawyers in the Bureau of Competition, and I

12 think they immediately contributed. I think that if I

13 was an enforcer and I saw all this talk about platforms

14 and nascent this and all this technology, I would want

- 15 a lawyer in the Bureau who has broad experience in
- 16 dealing with tech industries, who knows what questions
- 17 to ask, who's had experience, who has represented
- 18 startups, has represented big companies, sn151w.i07o's1m41082 15r5 0 10815.Mthiea

**327** 10/17/2018

- 1 are not enough deals in any one given tech market.
- 2 Tech is not a market, by the way. If it was, then
- 3 every deal can go through.
  - There are many subverticals in technology.
- 5 There are many subverticals in search. There are many
- 6 subverticals in advertising. You can't ask somebody
- 7 who's an expert in one of those verticals to analyze
- 8 code in another vertical and say, was this written
- 9 properly.

4

- 10 The other problem is, and the really
- 11 scary thing from my perspective is, if you have
- 12 technologists who you're asking cod.18 T2nan ex.ck reallook rt5.2 418.68 Tm 0 Tc (12)

1	developer who writes code keeps a journal and says,
2	this is the code I'm inserting, this is why I'm
3	inserting the code, and they're not thinking, well, in
4	20 years I might be investigated by the FTC, so let me
5	not tell the real reason why I'm doing it.
6	They actually say, I'm doing it to solve this
7	problem, or I'm doing it to frustrate this issue. So
8	go back and do what you would do in any single deal.
9	Talk to the engineers, review the documents, talk to
10	the executives, talk to industry experts. Again I
11	think you know, I've had the good fortune of working
12	on a lot of the deals that have been mentioned today
13	involving, you know, in Google-Waze, Zillow-Trulia,
14	Google-AdMob, FanDuel-DraftKings, Bazaarvoice. Some of
15	them have gone my way; some of them haven't gone my
16	way.
17	But what I can say is that the agency
18	analyzed the deals correctly in every instance. I
19	might not have agreed with the outcome. Maybe I think
20	that they've weighed certain factors differently than

21 what I would have weighed them as. But all the thingsanaly20might But wA/B thstwe

- 1 know, in an investigation with Barbara Blank, we
- 2 probably produced 10,000 A/B tests to staff, and they
- 3 reviewed them all. So, you know, the agencies -- trust
- 4 me, the agencies understand how to analyze these deals,
- 5 they're doing it in a way that's consistent with merger
- 6 policy and with the law. And to contemplate changing
- 7

1	MR. MOISEYEV: Any comment that ends with
2	"call your congressman" is fine by me. Having wrestled
3	that issue to the ground, maybe I'll move on to sort of
4	more substantive issues and away from the process.
5	Debbie, you and I have talked many times over
6	the years. I'm going to jump back into the boxes of
7	antitrust, that is unfortunately the world, I think,
8	that we live in. And looking at a potential
9	competition case, I think most of these, in my
10	experience, revolve around how likely the entry has to
11	be before it raises a competitive concern in a merger
12	case.
13	What is your sort of sense of how likely the
14	entry has to be to trigger a Section 7 issue?
15	MS. FEINSTEIN: Yeah, so, I mean, the courts
16	haven't really given us a lot of guidance on this. So
17	in some ways that's freeing to the agencies to say
18	we're going to figure out the level of likelihood that
19	seems right to us, you know, until the court tells us
20	otherwise. And I don't think that the Commission staff
21	follows the BAT clear proof standard unless you define
22	clear proof as something different than I do, which is
23	absolute certitude, 100 percent, and there's no
24	possible obstacle that in the next two years until the
25	product is on the market something could go wrong.

1	I mean, if that's the definition of clear
2	proof, that is clearly too high a standard. But it's
3	got to be something more than a case I worked on once
4	that ultimately did not go when I was on the outside
5	and the staff did not end up proceeding with it, but it
6	was somebody very low level thought of entering the
7	product and the staff's theory was, well, you really
8	need to be in this product because others in your space
9	are in this product. I mean, that's not sufficient to
10	go on.
11	You know, what you want to see is that
12	there's a bunch of evidence that all points the same

**332** 10/17/2018

1	contracts with them. How can you come try to tell me
2	that you're actually not making real steps to enter
3	this? So I mean, it's a bunch of different factors
4	that really go to the question of, you know, does the
5	evidence point in one direction as opposed to another
6	direction. It's really the question of why in
7	pharmaceutical deals we look at things that are fairly
8	far along, not when there's just a named molecule
9	because there's so many things that could go wrong. We
10	don't say that it's likely and because the investment
11	hasn't been made.
12	But I think that for the most part there's
13	not a whole lot of confusion about the kinds of cases
14	that will raise questions of potential entry, future
15	entry. So I don't worry that there's some big gap in
16	the you know, between the outside lawyers and the
17	Commission staff as to what it is we're talking about
18	when we're talking about entry likelihood.
19	MR. MOISEYEV: Well, let me take that a
20	little bit further because if the evidence sort of has
21	to point one way or another or that there is some
22	significant probability of entry, doesn't that
23	necessarily mean that you're going to lose the ability
24	to challenge potentially anticompetitive deals where
25	the entry is less certain but is greater than zero?

1	Dave, do you want to take that question?
2	MR. GELFAND: Yeah, thanks, Mike. First of
3	all, let me begin by also thanking Bilal and Stephanie
4	and Elizabeth and the policy group for organizing these
5	hearings and also for inviting me, especially for
6	inviting me to participate on such a great panel with
7	such great fellow panelists. I'm grateful for that.
8	So, Mike, you know, this is something that
9	I think is addressed in the case law. I think it's
10	addressed by the standard the burden of proof. I
11	

**334** 10/17/2018

- 1 most part.
- 2 Now, a couple of things. I want to pick up
- 3 on one thing that Ray said, which is you have to think
- 4 about the uniqueness of this potential entrant, this
- 5 nascent entrant. And one thing that I think was a
- 6 little lost in all of the discussions that I've
- 7 listened to today is we talk about large companies
- 8 buying nascent competitors but very little discussion
- 9 about what the other nascent competitors are out there.
- 10 Oftentimes, these are markets where ten companies have
- 11 entered in the same way.
- 12 And so there also has to be some uniqueness

## 1 Lawyers in the Government are damn good at 2 looking at these cases and damn good at building cases 3 based on the documentary evidence, the data, 4 testimonial evidence. They have enormous power to 5 compel testimony in the investigative phase. And 6 you're good at doing it. And the one thing I would say 7 is you're even better than you think, because I think 8 you could make these decisions a whole lot faster. 9 And if I had one thing to say to the agency 10 on this panel, I would say that this does apply 11 especially to some of these technology markets. You've 12 got to make these decisions in fairly guick order. 13 Sometimes the markets are dramatically affected simply 14 by holding up a deal for a year during an investigation 15 and then another six months during litigation. Get 16 your investigation done in three or four months. You 17 can do an enormous amount of work in three or four 18 months. You can get a lot of documents, you can get 19 lot of data, you've got big teams that work on these 20 cases. And that's the best way to enforce the law in 21 this area, not try to create a special standard or, you 22 know, sort of put the thumb on the scale. 23 And by the way, one other thing. Why would 24 you create a special standard for an area of

25 competition that is the most speculative? It's the

1	hardest one to say there's actually going to be harm.
2	Are we just trying to create rules that make it easier
3	to bring cases? That shouldn't be what's going on
4	here. You should live by the rules that exist. If you
5	can't prove a case, then go out and develop better
6	evidence about what nascent competition means, about
7	what the effects are. Do the kinds of studies that
8	some of the panelists today have talked about doing.
9	But you got to do more than just come onto
10	panels and talk about it. You have to publish your
11	results; you have to convince your peers in the
12	scientific area that you practice in, whether it's
13	economics or technology. You got to convince them that
14	there's some consensus around the science that you're
15	developing so that you can then take it to judges and
16	admit it under the rules that apply to expert
17	testimony. So that's what's going to have to happen,
18	not create a new standard that just makes it easier to
19	bring the cases.
20	MR. MOISEYEV: Wow. So I'll remember that
21	next time I call on you, Dave. I appreciate the
22	admonition that a little harder work on our side is all
23	that's necessary to get to the prompt resolution of
24	your client's cases. We should have had Paul Denis up
25	here. He would have been the Grecian courts telling

- 1 you how that's the singular metric to measure agency
- 2 performance by.

3 Let me, let me shift to something that really 4 is at the heart of any antitrust case, and that's how 5 do you measure effects. So all of these cases boil 6 down to what's your story of anticompetitive effects. 7 And in a potential competition case, you don't have 8 necessarily the historical experiences to draw on that 9 often color a lot of these cases. 10 What do you do -- I guess, Scott, I'm going 11 to call on you, even though it's sort of unfair because 12 I'm going to ask you to explain the government side. 13 If you're trying to prosecute a case, what kind of 14 effects evidence would I look to try to show that these 15 transactions are anticompetitive in the absence of that 16 type of historical experience? 17 MR. SHER: Right. So that is one major 18 difference between transactions in these markets and 19 transactions in traditional brick-and-mortar deals. A 20 lot of the competitors don't really have a track record 21 of experience. But like what I've been talking about 22 before, the same tools that are available during 23 investigations in these potential competition or 24 nascent competition cases that are available in 25 traditional cases actually do work.

1	So what are some of the things? Why does the
2	acquiring company want to acquire the nascent
3	competitor? What is the procompetitive justification
4	for doing it? Is it output expanding, or are they
5	concerned about whether or not the company that they're
6	buying represents a potential competitive threat to
7	their position in the market?
8	And I'll give one example. In
9	Facebook-Instagram, which again I think that the agency
10	analyzed using the correct framework, I represented a
11	third party in that case, so I had a vested interest in
12	maybe concluding that the transaction was problematic.
13	But if you look at what Mark Zuckerberg actually told

14 his investors at the point of time when he wanted to

1	other deals. Why is the deal being done? What do
2	ordinary course business documents say? What does the
3	potential competitor believe that its position is going
4	to be going forward in the future? And what do other
5	people in the industry believe that that potential
6	competitor represents?
7	Just staying with the Facebook-Instagram
8	example, one potential thing that you might want to
9	look at, and it's something that Andrea had mentioned
10	before, is what are the usage statistics of Instagram.
11	There were 10 or 11 or 12 other photo-sharing
12	applications that were in existence and relatively
13	similar in funding size to Instagram at the time that
14	it was acquired by Facebook. What were the usage
15	statistics? It's interesting, if you looked at the
16	mobile usage statistics of Instagram versus some of the
17	other competitors that were available on the market at
18	the time, Instagram was actually doing pretty well.
19	Now, there were substantial challenges, and I
20	understand why the agency didn't bring that case.
21	Instagram had been founded less than 12 months before,
22	Instagram had 11 employees, and Instagram really had
23	come up with the photo-sharing app. So it is a really
24	difficult case to prevail on if you wanted to bring a
05	and like that to accust

case like that to court.

1	But if you're considering what are the sorts
2	of things that I should be looking at in deciding
3	whether or not a potential competitor is relevant,
4	they're there. You have the evidentiary tools to
5	decide whether or not on balance it's worth bringing
6	the case or not. And, again, the agency gets it right.
7	You guys look at the right data. You know, you might
8	not weigh it in the same way that I would have weighed
9	it, and you might have, you know, a conflict as to what
10	is the proper enforcement role of the agency. Should
11	you intervene early to ensure that as many as
12	competitors can develop as possible? Or do you allow
13	the market to operate the way it would absent
14	regulation? And that's a philosophical reason to block
15	or not block a transaction, and that really just goes
16	to whether or not the decision-maker weighs the
17	evidence in the same way that other third parties
18	would.
19	So, again, Mike, that was a long answer, but
20	you don't have the pricing evidence, you might not have
21	the market experience evidence, but there are indicia
22	

22

1	to spend we'll spend a couple minutes talking about
2	some of these cases specifically. I think that would
3	be helpful to hear from you guys. And maybe we've
4	already had the preview on Facebook-Instagram.
5	I wanted to quickly ask Dave about whether it
6	would make sense from an enforcement perspective,
7	whether we should have presumptions in potential
8	competition cases. So we, in the normal Section 7
9	case, you establish a market, you establish market
10	shares, the Government has made its presumption. Now,
11	you don't have that tool available in potential
12	competition cases, and the real question is whether
13	that would be something that would make this a more
14	predictable and sort of a little less wild west area of
15	the law.
16	MR. GELFAND: Well, I don't think there
17	should be a presumption. I know that probably doesn't
18	surprise you, but I don't think we have enough
19	experience, and nobody has articulated what are the
20	characteristics of a potential competition case, that
~ (	

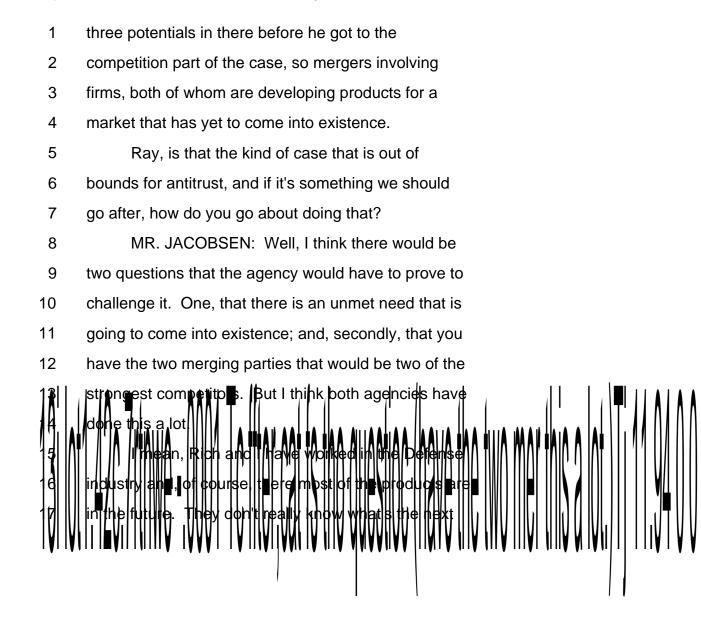

21 you can look back on a body of experience and say,2118

1	rule should only apply once you have a certain body of
2	case law, finding time and time again that something is
3	anticompetitive.
4	And it's not just the absence of cases
5	finding anticompetitive effects that you can say
6	there's enough there to create a presumption. But as
7	far as I know, an awful lot of these transactions are
8	procompetitive for the reasons other people have
9	discussed. They give small entrants like Instagram at
10	the time Facebook acquired them a platform. They give
11	it technology, synergies; they give it capital,
12	engineers, distribution. And so how are you going to
13	create a presumption in a set of cases where, you know,
14	arguably most of the transactions that we're familiar
15	with have actually been procompetitive.
16	So I think it's very different from
17	concentration measures and existing competition cases.
18	MS. FEINSTEIN: If I could interject, I think
19	we kind of do have a presumption, which is the
20	concentration measures. I mean, a lot of times, what
21	we're trying to predict, maybe not as perfectly as
22	this, is the HHI is, is it one of only a few entrants,
23	you know, is it going to be four to three, is it going
24	to be three to two? I mean, that's what we do what
25	we did when I was at the agency in the pharma mergers.

1	So I think just broadly there are presumptions, but
2	they're totally in line with do we think this company
3	is going to come in and be significant because if it's
4	market at 1600 and we think that the entity coming in
5	is going to get a 2 percent market share, well, then,
6	we don't worry about that.
7	But if we see lots of evidence that this
8	is a company that's going to come in and take the world
9	by storm and have a really big market share, then I do
10	think we do. So I don't think we need new presumptions
11	because I think we're sort of even though we may not
12	always articulate it quite as clearly we are
13	thinking in terms of the concentration levels and
14	market structure issues that worry us normally, and
15	we're just sort of applying the same but trying to get
16	at it with different kinds of evidence.
17	I mean, when you look at the cases that we
18	did when I was there where I just remember those
19	better, you know, the evidence would suggest that
20	companies multiple companies were thinking about the
21	industry and the impact of a new entrant the same way.
22	You know, in Mallinckrodt, there were two different
23	companies that maybe were going to acquire the assets
24	of the acquired entity that instead got bought by the
25	dominant firm and both of them had very similar

1	internal documents in terms of how quickly they could
2	get to market, what the market share was going to be,
3	and what the price effect was going to be.
4	And that's pretty good evidence, and it fit
5	into the, okay, there's only a couple of people who are
6	going to do this. It's going to have a significant
7	market share, and we're able to show the actual affect
8	on competition because they have both predicted very
9	similar to each other what price they would be able to
10	come in at, what the uptake would be, and, therefore,
11	how the market would react.
12	MR. GELFAND: Okay, so I've been on
13	approximately one million panels with Debbie, and I've
14	never disagreed with her before, but I have slight
15	disagreement. What you described is not a presumption.
16	It's proving the case. Okay, once you carry your
17	burden of proof and you demonstrate anticompetitive
18	effects, fine, then the burden obviously shifts to the
19	other side to rebut that prima facie case. But I think
20	that's different from
21	MS. FEINSTEIN: Fair point, but to just say
22	one more sentence, which is, I mean, I really don't
23	think there's a presumption in the normal horizontal
24	case because if you think that anybody at the agency
25	ever sits down after they say, "and the market shares

**346** 10/17/2018

**347** 10/17/2018

1	and you have to identify what that is, and it needs to
2	be in the reasonably near future, then clearly I think
3	that's an easier case really, I think, for the agency
4	to prove because it's got substantial facts about the
5	merging parties and what they can do so they can focus
6	on, okay, how do we articulate what that unmet need is.
7	MR. MOISEYEV: Let me shift away from I'm
8	sorry, Debbie, do you want to weigh so we faced
9	something like that in Nielsen-Arbitron. I don't know
10	if you had any thoughts of the challenges. That was a
11	case we did together.
12	MS. FEINSTEIN: Sure. I think it really
13	depends on the facts of the case. Sometimes it's
14	very easy because you can define the market. You know,
15	the only two companies developing a generic
16	pharmaceutical product, I mean, that is a really easy
17	case to bring, right, which is why they always settle,
18	because you can clearly define what the market is. It
19	is the generic, you know, whatever.
20	Sometimes, and Nielsen-Arbitron was one of
21	them, and if you go back and look at the complaint,
22	it's a long description of the product market. One FTC
22	acanomist ance told me that I probably was on thin

- economist once told me that I probably was on thin
- 24

1	close to that in the cappe that there were a let of
	close to that in the sense that there were a lot of
2	adjectives, but it's how the customers described the
3	market to us.
4	And so, you know, it's going to be tougher
5	when there's, you know, a debate about how exactly do
6	you say what it is that's being developed when it isn't
7	done. I don't think that ought to keep you from trying
8	to say, hey, look, this is the problem that's being
9	solved. And in that case, it was a problem that was
10	being solved, which is bringing together data from, you
11	know, TV viewers and radio viewers and online viewers
12	and putting it all together.
13	I think it's an articulation issue. And, you
14	know, that's always tougher for, you know, to have to
15	tell a story in court, but it can be done if you have
16	the facts to show, hey, this is what they're out
17	touting to the marketplace they're going to do, and
18	customers are saying, yeah, they came to me with this
19	solution. I may not call it the same thing as the
20	customer down the street, but we all know what we're
21	talking about here. You just have to be able to
22	explain that all to a judge.
23	MR. MOISEYEV: So let me talk about a
24	slightly different situation. That's not a firm that

25 is -- sort of has the idea of entering a market, but a

ý	
substantial an effect it will have on them. And I'd	
look at the documents seriously from both sides.	
I'd look at patents. I'd say, well, you	
know, the A side has a bunch of patents, and the B side	
has bunch of patents. You add those up, what's that	
make the future of this market look like? I would	
and certainly I think we've talked about it here	
there's got to be uniqueness. Is there something	

9 distinctive about the B side here? There isn't anybody

10 else out there doing it, and I mean, there's 12 guys

11 who've come up with this company, you know, in Palo

12 Alto, or there's 12 guys in Los Altos who are doing the

13 same thing.

1

2

3

4

5

6

7

8

14 I would most certainly -- I would most

15 certainly want to know that. I'd look at the

16 equipment. I mean, if you -- if these two merge, will

17 they have some sort of monopsony power in hiring the

18 type of technocrats and technical people and scientists

19 to do this? Will they have some kind of a dominant

20 position or some monopsony position in the fancy

21 equipment you have to do this.

And, then finally, I would go to -- I would
get some expert testimony as to somebody who -- you
know, I might even look at an investment banker or
somebody, be one of the things I'd look at and say,

1	look, the people you know, what do you think? I
2	mean, would you does this look like a good
3	investment going forward? I'm not sure you'd call
4	somebody like that because they can always be
5	cross-examined, and they have opinions on everything,
6	but, nonetheless, they might be able to give you some
7	information. And then the type of technologist who
8	really understands these markets.
9	But that's what I'm getting back to is that
10	if I was in that position I would want somebody and
11	it's not me, I can barely operate my phone but I
12	would somebody who knows the Silicon Valley and who
13	knows you know, can look at this stuff and say, you
14	know, these guys really have something going here and
15	that's why they're paying a gazillion dollars. I would
16	want to have that kind of information as well.
17	And that's why I thought maybe getting some
18	generalized Silicon Valley technology help might be
19	helpful here. But the key is substantial and the key
20	is likely, and that's the laundry list I can think of,
21	but maybe others have other bright ideas.
22	MR. GELFAND: Well, I was going to just
23	disagree respectfully with one point, Rich.
24	MR. PARKER: But you disagree with me on
25	every panel.

**355** 10/17/2018

1	price, we can't imagine why they would be doing this if
2	it wasn't anticompetitive. There's all kinds of ways
3	that you can imagine they would be doing that. Go get
4	the evidence. If you've got evidence that it's
5	anticompetitive, that's fine; otherwise, the price has
6	absolutely no evidentiary value whatsoever.
7	MR. PARKER: All right, so you're defending
8	the case, and the judge says, Mr. Gelfand, you've been
9	telling me what a peanut, what a baby this company is
10	for the last two days, why are you paying your
11	client paying a gazillion dollars for this zero
12	company?
13	MR. GELFAND: Well, I'm probably not going to
14	say it's a zero company if they paid a billion dollars
15	for it. I'm going to say it's a great company. It's
16	just not eliminating any competition.
17	MR. PARKER: All right, well, that sounds
18	like substantial and likely to me. I mean, look, so
19	I'm not thinking of the I'm thinking somebody in
20	black robes is going to wonder why you're paying a
21	gazillion dollars for this company that's got no likely
22	effect on anything. That's what I'm saying.
23	MS. FEINSTEIN: And if I could interject
24	because I'm in the middle of these two. Let me try to
25	bridge the gap here, but I don't think I'll be

1	successful.
2	MR. GELFAND: I predict I'm going to agree
3	with Debbie on this one.
4	MR. PARKER: I said, Mike, I cannot sit next
5	to Dave.
6	MS. FEINSTEIN: The acquirer could be
7	uniquely able to get efficiencies out of combining the
8	two companies that nobody else could. And a great
9	example of that, I think, and I confess I worked on the
10	case, and Mike will no doubt have a different view, is
11	Genzyme-Novazyme. Genzyme-Novazyme was a consummated
12	deal. I really wonder whether that would have been
13	challenged if it wasn't consummated because you
14	wouldn't have known. But because it was consummated,
15	we were able to show the efficiencies and the unique
16	combination of companies that by working together could
17	create a drug that companies had been working on for 50
18	years.
19	So great, and I can't believe I'm saying
20	this, but President Trump brought the daughter of the
21	CEO of the acquired firm to the State of the Union to
22	talk about the fact that she was in college. We
23	thought she was going to die during the case.
24	There was nobody else who could have seen the
25	value in that or could have developed it because they

- 1 didn't have the same technology and they were coming at
- 2 it. So to them -- and I don't think they paid a
- 3 particularly high price, that's why it wasn't
- 4 reportable, but they could get value out of it that
- 5 nobody else could. And it was worth it to them, and
- 6 those kinds of efficiencies are meaningful.
- 7 I just want to make the contrary point, which
- 8 is people are talking about all the ones that the
- 9 Government misses, but there's a lot that the
- 10 Government guessed on and got wrong, and that's just
- 11 going to happen. And my favorite example is gene
- 12 therapy where the press release talked about how it was
- 13 going to be saving lives to block this merger and have
- 14 these two different companies trying to innovate on
- 15 gene therapy.
- 16 I've always wondered, if you brought them
- 17 together and maybe other companies together, maybe
- 18 there would have been better innovation on gene therapy
- 19 because you'd had a lot of really smart people in the
- 20 room together. It's very hard to predict this stuff,
- 21 but I think there be can be real efficiencies, and
- that's why somebody might want to pay for a company
- that to the rest of the world looks not as valuable.
- 24 MR. MOISEYEV: Much as I would love to turn
- this into a pharma panel where I'd feel at least on

1

2

3

4

## were a real company. They were a startup. They'd only been around less than two years, but, you know, they did have a decent size, and they did look like they were on a good trajectory. You might have been able to

5 show substantial substantiality. 6 But it's interesting, you get into the 7 Section 2 case and the word "substantial" is not there. 8 You have to show a competitive effect, and it seems to 9 me that the courts are saying, if you're excluding 10 somebody who really is a peanut, that's still excluding 11 somebody, and you can't do that. And by the way, if 12 you're a trial lawyer, okay, can you imagine defending 13 a Section 2 case and say, you know, we may have 14 excluded Paul Denis' company, but he is so small it 15 doesn't make any difference. And then they'd say, Mr. 16 Parker, so you're saying that it's open season on small 17 companies? Well, I mean, that's not an effective way 18 to defend a Section 2 case at all. And so there is an 19 absence of substantiality there that I think is very 20 important in the Clayton Act context. 21 You mentioned Actavis, and I think that --22 I mean, and I don't want to get Debbie all riled up 23 on me, but Actavis is -- she and I have gone around 24 on this one before. And Actavis, I think you need some

25 -- another trip to the Supreme Court to find out what

1	buying Paul Denis' company doesn't make any difference
2	because he doesn't make any difference. With all due
	,
3	respect to Paul, but that's what I'm saying. You can
4	make that argument under 7; you really can't under 2,
5	unless I'm missing something.
6	MR. MOISEYEV: That's it?
7	MS. FEINSTEIN: Look, you were going to tee
8	up a question to me, and it's in the script, so, look,
9	I think we could debate all day long about Section 2
10	and Section 7, and we could debate all day long about
11	how whether Microsoft and Rambus are consistent or
12	not consistent, and way smarter people than I will have
13	views on this. The important point to think about for
14	merger enforcement is, is the fact that there is some
15	uncertainty about precisely what the law is on
16	potential competition or precisely what the law is
17	about a monopolist buying a nascent competition, is
18	that scaring off the FTC from bringing cases?
19	I can't speak to the DOJ; I'll let Dave do
20	that if he has a view. I don't think it is. And
21	Mallinckrodt is the best example of a case where not
22	only were we not scared off, we were so sure of our
23	case or at least willing enough to take on the case
24	that we got a very big disgorgement figure. So at some
25	point the law may be a deterrent to bringing these

1	kinds of cases but not at the moment. Staff is not out
2	there saying, ooh, we're not sure how we're going to
3	write the footnote about Rambus, so we better not bring
4	this case.
5	They're going, is there a problem? Yes.
6	Let's figure out how to write a really good complaint
7	and tell a story to a judge and, you know, we'll fight
8	about the law if we have to. So far that hasn't
9	happened; down the road it might. And it might be that
10	we're all talking here ten years from now as on a panel
11	that we had earlier, you know, folks were all saying,
12	oh, you know, AmEx got it wrong and the world is going
13	to come to an end because of that decision, and maybe
14	there will be a similar decision on potential
15	competition that we'll all be concerned about, but
16	that's not a deterrent right now to bringing the kinds
17	of cases that I think folks think should be brought.
18	MR. MOISEYEV: We don't have a lot of time
19	left, and I really there are a couple of very good
20	questions on areas that I wanted to touch on here. So
21	I want to first ask a question about retrospectives
22	that I think there was a rather lively conversation on
23	the last panel about retrospectives and whether sort of
24	given the uncertainties that you have in these cases

about how things are (363)Tj s8 Tmn0 0 11.94 115.2 vesatTm e1 SonId is going

1	strategy be to wait and see? And if they turn into
2	Instagram that all the kids love, then bring the case.
3	And if they turn into the Friendster or whatever I'm
4	hopelessly out of my depth now after two websites, but
5	and then that's a great filter, right, the real
6	world, the real world experience?
7	Scott, can you give me thoughts on that?
8	MR. SHER: Yeah. So I think that would be
9	dangerous. I think that would be dangerous for a
10	number of reasons. I think, look, retrospective
11	studies are interesting and sometimes they're
12	important, but if you were to conclude, for example,
13	well, Instagram has become popular so now let's bring
14	the case, you have to ask yourself what's the reason
15	that Instagram has become so good. Has Instagram

become so good because inherently it Tj 12 0 0 12 15dn Tm -tigood. Has Instagram

1	Google-YouTube deal. But that doesn't answer the
2	question as to why YouTube is great today. Is YouTube
3	great today because it was going to be great absent the
4	acquisition by Google? I don't know if people remember
5	this, but back in 2005, that website was actually still
6	funded by credit card debt by two people who were
7	running it out of their garage. I mean, was that
8	company likely to become really large as a result of
9	you know, if it wasn't acquired by Google, or did it
10	become large because it had access to the resources of
11	a Google to make it large.
12	So I think going back and doing that sort of
13	retrospective is very problematic. You can draw very
14	erroneous conclusions as a result of it. I'm not
15	suggesting that retrospectives are bad, but I think in
16	technology markets where things change very rapidly,
17	where there are a lot of reasons why something might
18	become successful or might fail, you have to be really
19	careful to attribute the deal to the reason of the
20	success of the competitor that was acquired. You can't
21	just say, well, the company became big, therefore, we
22	should probably have challenged the deal in the first
23	place. I think you would get a tremendous number of
24	false positives.

25 MR. MOISEYEV: Well, let me -- I mean, I

1	think Professor Yun said that I hate to be quoting
2	him, God knows, probably some false premise with my
3	question. But, you know, he said everybody's for
4	retrospectives. Is everybody here sort of for
5	retrospectives, the way Scott apparently is?
6	MR. SHER: Just one more quick thing. I'm
7	not in favor of retrospectives from the perspective
8	per se. What I actually think, and I had mentioned
9	this earlier, what I think the agency should do,
10	because there seems to be a lot of confusion by a lot
11	of people who are actually not practicing, well, do the
12	agencies just not understand how to do these deals?
13	Well, they actually do understand how to do these
14	deals.
15	So how do you rectify the problem that no one
16	knows that the agencies understand how to do the deals,
17	but they're actually doing them correctly? They should
18	issue more closing statements. The agency should
19	explain to the public, what did you look at, why did
20	you look at it, why did you reach the conclusion you
21	reached, what other conclusion could you have reached.
22	Some of the best decisions that have come out
23	of the FTC in my opinion over the course of the last 15
24	years are Genzyme-Novazyme, where there was an
25	extraordinarily detailed closing statement, and the

25 extraordinarily detailed closing statement, and the

1	cruise line case. And those are cases where the FTC
2	actively took steps to explain to the rest of the
3	market why they took the actions they did. Those are
4	the sorts of things that I think would help increase
5	knowledge as opposed to just going back and saying,
6	well, something is successful, now we should go back
7	and retrospectively challenge it.
8	MR. MOISEYEV: Anybody else have something on
9	retrospectives? If Rich wouldn't use our closing
10	statements against us when we sue him, it would
11	probably be much more the agency would be more
12	prolific in that regard.
13	MS. MURINO: I'll just add, I agree closing
14	statements are really valuable and would encourage the
15	Commission to do those very often, maybe even on the
16	level of the way some of the Europeans do it at the
17	E.C. level, some of the member states do it. I think
18	it's a great idea. I also think that internal
19	retrospectives, and I worked for Bill Kovacic, who
20	obviously spent a lot of time thinking about the FTC as
21	an institution, and I think there's value to the FTC
22	doing retrospective studies, even if you don't release
23	it to us. Obviously, I'd prefer you would release it
24	to us. But I think that there's real value to being
25	able to have the staff go back and look at what they

1	did and see what they missed, see what they did well.
2	I think sometimes you can learn an awful lot
3	from that to give you confidence to go ahead. And so I
4	would encourage, even if you're never going to tell me
5	what you find, for you all to go back and think about
6	ways that you did well on this deal and here is where
7	you fell a little bit short.
8	And certainly having the 5(b) authority to be
9	able to get data from parties once those once
10	transactions have closed, I know there's paperwork
11	involved, that you have to go to OMB, it's very
12	complicated, and I won't pretend to understand it, but
13	having that ability, I think, means you'd be able to
14	really do something meaningful, even if you never tell
15	me about it.
16	MR. GELFAND: Yeah, I agree with that, but I
17	have to say, like any scientific work, a study needs to
18	be unbiased. And when you've got the people who were
19	making the decisions studying the outcome of the
20	decisions, that is not unbiased study. So I think it's
21	great. I think if the agencies want to do it, that's
22	great. I think they've got a lot on their plates, and
23	it's hard to go back and look at old stuff when you got
24	a bunch of new stuff coming in.
25	MR. SHER: Particularly when David is telling

1 you to go really fast.

2 MR. GELFAND: Yeah, you got to go really

3 fast. You got to go really fast, Paul. I hope you got

4 that down.

5 But, you know, other people need to do it,6 and we've heard some examples on the panels today, and

7 even though I don't agree with everything people have

8 been saying, I definitely agree with the scholarship of

9 it all. Study this. Convince other people. Don't

10 just say your opinions, do the work, make it

11 verifiable, replicatable, all the things that

12 scientific work is, be unbiased, and eventually this

13 body of work will lead to conclusions.

14 MS. FEINSTEIN: Just one quick sentence. I

15 think the Commission does that all the time. They

16 don't call it a study. They look at the industry again

17 in the next deal, and as part of that, they are looking

18 at whether or not the predictions of the last deal are

19 right.

And I think of one in particular, Mike and I
worked on it, where there was controversy over the
first deal. And when we went back to ask folks,
customers, how did it turn out. They, to a one, said,
oh, this was a great deal. This was a deal that had

25 been controversial as to whether or not it should be

1 the divestiture study back a lot. I mean, look, yes, 2 on the margin, but, you know, if that was just the 3 agency trying to show that it had done great, I think 4 it would have come up with a higher percentage of such 5 numbers. 6 MR. MOISEYEV: We tried to add more input 7 into that. 8 MR. GELFAND: That's actually one of the 9 things I had in mind as I'm thinking about that. 10 MR. MOISEYEV: All right. To avoid too much 11 thread drift here, I wanted to ask -- there was one 12 question that came in, more on this technologist which 13 I think just is something that spurs so much interest. 14 One of the questions was, if we had a budget, which is 15 almost hypothetical, not even worth contemplating, but 16 it was large enough to add ten people to the agency, do 17 you put them or any portion of those in to people with 18 this kind of expertise, given sort of what's happened 19 over the last three days here, what we've heard over 20 the last three days? Is it more attorneys? 21 You know, I probably could answer the 22 question about more economists, more commissioners. 23 There are a lot of possibilities that you can put the 24 resources that I might have my own views on. But, I mean, seriously, I think it is a good question because 25

- 1 it asks, you know, what is the need from the outside
- 2 perspective at the agency.
- 3 MS. FEINSTEIN: I got asked that question by 4 the Chairwoman, if I could have \$5 million, what would 5 I do with it. I mean, it was a serious question 6 because it was a time when we thought we might get some 7 special bonus. And I said, surprisingly, I'm sure, to 8 the lawyers in the room, sorry, no offense, I said more 9 economists. And the reasons is, A, we don't have 10 enough of them on the cases; and, B, I would love a 11 group of economists who could use the data and do 12 studies and, you know, maybe hire outside economists to 13 do the studies as well, that more studies was the one
- 14 thing I would want to spend money on.
- 15 MR. MOISEYEV: Anybody else have thoughts on
- 16 that?
- 17 MR. SHER: I agree with -- particularly if
- 18 you're talking about technology deals. The one thing
- 19 -- you know, and Debbie and I worked on a deal where
- 20 there was -- when she was at the Commission. There was
- 21 sort of a tremendous amount of data. That is one thing

1 quickly.

2

1	MR. MOISEYEV: Or that's half an economist
2	based on the bills we're getting for experts.
3	(Laughter.)
4	MR. PARKER: I just want to say I totally
5	agree with Dave.
6	MR. MOISEYEV: I'm dumbfounded now.
7	MR. GELFAND: Maybe nine Ted Hassis and
8	one
9	(Laughter.)
10	MR. MOISEYEV: I feel like we've finally
11	reached consensus on our panel. We have a couple of
12	minutes to go, I was just wondering if anybody had
13	anything that they wanted to add before we close out
14	here.
15	MR. GELFAND: I'd like to add a comment to
16	the law students in the audience because I think there
17	might be some of you. This is a fabulous area of law
18	to practice in. There is so much going on, and I hope
19	you've seen through the interactions that have taken
20	place today how great a bar this is and how the people
21	really think hard about these issues, how they have
22	very civil discourse about it, and organizing things
23	like this, Bilal, where people can come together and
24	debate these issues, try to inform the agency about the
25	different perspectives, bringing scholars together with

**375** 10/17/2018

1	CLOSING REMARKS BY DOUGLAS H. GINSBURG
2	MR. MOORE: After a long but informative
3	three days of hearings, we have one final event that I
4	hope everybody could sit for and focus for just the
5	last ten minutes. We have quite a treat. Judge
6	Douglas Ginsburg is going to be giving closing remarks.
7	As many of you know, Judge Ginsburg is a
8	Senior Judge now on the U.S. Court of Appeals for the
9	D.C. Circuit, which he was the Chief Judge from 2001 to
10	2008. He's also a professor here at the Antonin Scalia
11	Law School here at George Mason University. And in the
12	1980s he was the Assistant Attorney General, Head of
13	the Antitrust Division. It may not make the first
14	paragraph of his bio, but one of his finer moments was
15	serving as my boss as a law clerk from 2008 to 2009 on
16	the D.C. Circuit. So it's a pleasure for me to
17	

- 1 little bit about, are essentially modeled after 2 hearings that were convened by Robert Pitofsky, 3 then chairman of the FTC in 1995. And in those 4 hearings, the Commission considered questions, some 5 of which are familiar to us today, such as -- well, the 6 broad general one is -- was then and is now --7 how antitrust law should be adapted in light of --8 and whether it should be adapted in light of 9 developments, innovation and increasing -- at that time 10 increasing globalization. 11 So my brief remarks today are going to focus 12 on the broad aspirations of this kind of review that's 13 taken place periodically. From the 1995 hearings, to 14 the report and recommendations of the Antitrust 15 Modernization Commission in 2007, to the hearings that 16 have been conducted these last few weeks, the 17 authorities, the Commission in particular, had to 18 confront whether and how existing tools should be 19 adjusted to meet new market realities. 20 It's hard to get into the subject without 21 first pausing for a moment to honor the work of Bob
- 22

1 the Commission and brought the agency to new 2 prominence. 3 Bob had too many accomplishments to be 4 recounted fully here, but more important than any of 5 those in particular was his approach to antitrust 6 enforcement, which was sharp and thoughtful and crucial 7 to the Commission's ability to confront new challenges 8 that it faced at the dawn of the 21st Century. 9 Throughout his chairmanship, Bob demonstrated 10 that a measured approach to competition policy could 11 reap great rewards for consumers. He vastly improved 12 the Commission's administrative processes in several 13 way, one important example being creating the fast 14 track for administrative litigation that significantly 15 improved the Commission's ability to resolve antitrust 16 cases in a timely fashion. 17 After leaving in 2001, Bob went back to 18 Georgetown University Law School and continued to teach 19 and write about antitrust -- teach antitrust and write 20 about it until the very end of his career. And today, 21 it's thanks to many of his accomplishments at the FTC, 22 and in no small part to the precedent that he set with 23 the hearings in 1995, that the Commission has been able 24 to bring together really top people in academia and 25 government, in law and in economics as well as

- 1 stakeholders and members of the public, to consider the
- 2 challenging issues that you all have been dealing with.
- 3 The 1995 hearings were officially called The
- 4 Global and Innovation-based Competition Hearings, and

5

- 1 to give you a sense of how times have changed and to
- 2 some degree have not changed, consider these selected
- 3 topic headings from the agenda.
- 4 How should antitrust define current
- 5 generation markets when firms compete on innovation (or
- 6 product attributes), as much as price?
- 7 Or what roles do antitrust and intellectual
- 8 property protection play in promoting innovation and
- 9 competition? You could have reused these, Bilal.
- 10 Finally, how do computer companies compete,

- 1 with the antitrust division, the joint venture project 2 in order to clarify the agency's policies regarding 3 collaborations among competitors and resulting in the 4 guidelines that were issued in 2000. 5 Not long after, the Congress, in 2002, wanted to know for itself whether the antitrust laws needed to 6 7 be updated in some way and created the Antitrust 8 Modernization Commission through an act of that title 9 in 2002, creating and tasking a new and temporary group 10 to investigate what should and should not be changed in 11 light particularly of globalization and of rapid 12 technological change, another familiar theme today. 13 And that was a bipartisan, 12-member 14 commission that invited the public to recommend topics
- 15 .08 576d 0 12 15n 20 idododl15cCr itself wyo2garding6

1 I'm quoting the report, "innovation, intellectual 2 property, and technological change are central 3 features." Pretty contemporary account, frankly. 4 Of particular relevance today, the AMC 5 concluded that because antitrust law is flexible and 6 open to new economic thinking, the agencies and the 7 courts have the tools that they need in order properly 8 to assess new marketplace developments and competition 9 issues as they arise. 10 Now, the current set of hearings, we've heard 11 and we're going to hear, continue to hear from a wide 12 range of experts and stakeholders about how the economy 13 has changed since 1995 and, indeed, even since 2007. 14 And it's true that even a decade ago the agencies 15 likely could not have foreseen some of the competition 16 issues now associated with big data, with privacy, with algorithms and so on. 17 18 And, indeed, the first case involving a 19 platform business to reach the Supreme Court was 20 decided only a few months ago. So this is all fairly 21 new stuff. With these new market realities, some 22 observers are now calling for really significant 23 changes in the focus of antitrust law. And I'm going 24 to highlight just a couple of them that have emerged in 25 recent years, and we've all heard, read, and perhaps

1 said something about one or both of them.

2 And the first is challenges to the consumer

3 welfare standard. The 1995 hearings did not call into

4 doubt the so-called core aspects of antitrust

5 enforcement regimes, which were said to have "served

6 the country well." Rather, they addressed adjustments

7 that the agency had to make, thought they should make,

8 in order to ensure vigorous competition and consumer

9 choice.

Now, as Chairman Simons noted when he gave
his opening remarks a couple of weeks ago, now the
hearing calls to expand beyond consumer welfare
standard and to consider all manner of other concerns

14 ranging from economic inequality all the way back --

15 and I take the word "back" advisedly -- to a concern

16 with the sheer size of firms, a consideration that was

17 explicitly repudiated in 1981, that was unmourned in

18 1995 and 2007, but here in 2018 is the subject of a

19 forthcoming book by Tom Wu, next month, called The

20 Curse of Bigness.

21 Second is the role of intellectual property.

- 22 As new products are devised to take advantage of
- 23 digital technology, the importance of IP rights has
- 24 increased throughout the economy, but the potential for
- 25 anticompetitive abuse of intellectual property has also

1 become an increasingly important antitrust concern. 2 And there's certain to be a continued debate throughout 3 the present hearings about whether the historical 4 protection that we've afforded to intellectual property 5 should be compromised in order to balance incentives to 6 innovate with market access for competitors. 7 Whether U.S. firms continue to dominate 8 technology markets worldwide is surely at stake in the 9 resolution of that question. Now, I'm not going to 10 belabor you at this late hour with my views on these 11 matters. They have been submitted to the Commission in 12 the remarks submitted by the Global Antitrust 13 Institute, to which I'm signatory, but they are 14 important issues on which a lot of perspectives are 15 going to be brought to bear. 16 In closing, I just want to leave you with 17 some conclusions I'm recycling from the report in 1995, 18 and I think they're still relevant. This is 19 the staff's conclusion. Effective antitrust 20 enforcement requires rules and processes that 21 facilitate accurate judgment in the face of inherent 22 uncertainty. Developing those new rules depends on a 23 cautious approach, reliance on specific facts, a 24 willingness to learn from the past, transparent 25 decision-making, and the articulation of competition

1	values whenever antitrust policy is being made.
2	I don't think we can do better than that. I
3	hope we can do that well this time around. Thank you
4	for your attention.
5	(Applause.)
6	(Hearing concluded.)
