# Price Effects from the Merger of Agricultural Fertilizer Manufacturers Agrium and PotashCorp

Nicholas Kreisle \*  
Federal Trade Commission

## Abstract

In 2018, Agrium and PotashCorp merged to become the world's largest manufacturer of potash, from which potassium is extracted for use as one of the three main nutrients in agricultural fertilizer. The merged firm held a 60 percent share of North American capacity, suggesting the merger may have been close to the enforcement margin. This paper studies the effects of the merger on North American potash prices relative to offshore prices and other crop nutrients. The evidence does not indicate that the firms were able to impose an anticompetitive price increase in the wake of the merger.

## 1. Introduction

Renewed calls to strengthen antitrust enforcement, and merger review in particular, often aim to use these policy tools as potential vehicles for increasing economic growth and reducing inequality.<sup>1</sup> While these arguments generally present aggregate statistics, merger review is conducted on a case-by-case basis. Retrospective analysis of mergers near the enforcement margin helps inform the question of whether current antitrust policy is too strong or too weak. This paper studies the merger of two North American crop nutrient fertilizer manufacturers, which is a particularly fitting subject because the agricultural sector is one of the areas where observers have noted concerns about rising concentration leading to higher input prices paid by farmers and higher food prices paid by consumers.<sup>2</sup> Focusing on agriculture also broadens the scope of the merger retrospective literature, which tends to study retail and formerly regulated industries, where data is more readily available.

Three primary nutrients – nitrogen, phosphate, and potassium (potash) – are used to make agricultural fertilizer. While each nutrient requires a different production process, several manufacturers produce all three. When Agrium and PotashCorp announced a \$36 billion merger to form the world's largest crop nutrient company in September 2016, some industry observers expected antitrust authorities to focus their regulatory review on potash, as the companies controlled 60 percent of North American potash capacity, compared to 12 percent for the other two nutrients combined.

However, in this case, a comparison with the prices of other crop nutrients could still be informative as to the merger's impact.

Phosphorus fertilizer supply shares many similarities with potash. Production begins with the mining of

Figure 1 plots each of the price series, with the thicker line representing the potash (MOP) price in the Corn Belt. The other potash prices, in Brazil and (for standard grade) in Southeast Asia, follow similar trends before and after the merger. All crop nutrient prices were trending upward just prior to merger, and followed just after

the merger. The price in Asia (the MOP price in the Corn Belt) followed a similar trend to the price in Brazil and Southeast Asia, but it was higher than the price in Brazil and Southeast Asia.

controls are not available in every control market, so these shifters are sometimes excluded as a robustness check. In every specification,  $X_t$  incorporates monthly dummies to allow for seasonality. Crop nutrient fertilizers can be applied in spring alongside seed planting, or after the fall harvest. Fertilizer is bought and sold yearround, and easily inventoried at various stages of the supply chain.

I estimate equation (1) via OLS separately for each of the available control markets. The identifying assumption is that supply and demand shocks not included in  $X_t$  affect treatment and control markets equally. In that case, differencing allows us to interpret  $\tau$  as the (logrpoint) change in prices associated with the merger. Given traderrrelated developments in 2019, alternate versions of (1) estimate the postmerger variable separately for 2018 and 2019.

As an alternative specification, I also estimate the full panel of data using the following equation:  $\ln p_{it} = \alpha + \beta_1 D_{it} + \beta_2 D_{it}^2 + \beta_3 D_{it}^3 + \beta_4 D_{it}^4 + \beta_5 D_{it}^5 + \beta_6 D_{it}^6 + \beta_7 D_{it}^7 + \beta_8 D_{it}^8 + \beta_9 D_{it}^9 + \beta_{10} D_{it}^{10} + \beta_{11} D_{it}^{11} + \beta_{12} D_{it}^{12} + \beta_{13} D_{it}^{13} + \beta_{14} D_{it}^{14} + \beta_{15} D_{it}^{15} + \beta_{16} D_{it}^{16} + \beta_{17} D_{it}^{17} + \beta_{18} D_{it}^{18} + \beta_{19} D_{it}^{19} + \beta_{20} D_{it}^{20} + \beta_{21} D_{it}^{21} + \beta_{22} D_{it}^{22} + \beta_{23} D_{it}^{23} + \beta_{24} D_{it}^{24} + \beta_{25} D_{it}^{25} + \beta_{26} D_{it}^{26} + \beta_{27} D_{it}^{27} + \beta_{28} D_{it}^{28} + \beta_{29} D_{it}^{29} + \beta_{30} D_{it}^{30} + \beta_{31} D_{it}^{31} + \beta_{32} D_{it}^{32} + \beta_{33} D_{it}^{33} + \beta_{34} D_{it}^{34} + \beta_{35} D_{it}^{35} + \beta_{36} D_{it}^{36} + \beta_{37} D_{it}^{37} + \beta_{38} D_{it}^{38} + \beta_{39} D_{it}^{39} + \beta_{40} D_{it}^{40} + \beta_{41} D_{it}^{41} + \beta_{42} D_{it}^{42} + \beta_{43} D_{it}^{43} + \beta_{44} D_{it}^{44} + \beta_{45} D_{it}^{45} + \beta_{46} D_{it}^{46} + \beta_{47} D_{it}^{47} + \beta_{48} D_{it}^{48} + \beta_{49} D_{it}^{49} + \beta_{50} D_{it}^{50} + \beta_{51} D_{it}^{51} + \beta_{52} D_{it}^{52} + \beta_{53} D_{it}^{53} + \beta_{54} D_{it}^{54} + \beta_{55} D_{it}^{55} + \beta_{56} D_{it}^{56} + \beta_{57} D_{it}^{57} + \beta_{58} D_{it}^{58} + \beta_{59} D_{it}^{59} + \beta_{60} D_{it}^{60} + \beta_{61} D_{it}^{61} + \beta_{62} D_{it}^{62} + \beta_{63} D_{it}^{63} + \beta_{64} D_{it}^{64} + \beta_{65} D_{it}^{65} + \beta_{66} D_{it}^{66} + \beta_{67} D_{it}^{67} + \beta_{68} D_{it}^{68} + \beta_{69} D_{it}^{69} + \beta_{70} D_{it}^{70} + \beta_{71} D_{it}^{71} + \beta_{72} D_{it}^{72} + \beta_{73} D_{it}^{73} + \beta_{74} D_{it}^{74} + \beta_{75} D_{it}^{75} + \beta_{76} D_{it}^{76} + \beta_{77} D_{it}^{77} + \beta_{78} D_{it}^{78} + \beta_{79} D_{it}^{79} + \beta_{80} D_{it}^{80} + \beta_{81} D_{it}^{81} + \beta_{82} D_{it}^{82} + \beta_{83} D_{it}^{83} + \beta_{84} D_{it}^{84} + \beta_{85} D_{it}^{85} + \beta_{86} D_{it}^{86} + \beta_{87} D_{it}^{87} + \beta_{88} D_{it}^{88} + \beta_{89} D_{it}^{89} + \beta_{90} D_{it}^{90} + \beta_{91} D_{it}^{91} + \beta_{92} D_{it}^{92} + \beta_{93} D_{it}^{93} + \beta_{94} D_{it}^{94} + \beta_{95} D_{it}^{95} + \beta_{96} D_{it}^{96} + \beta_{97} D_{it}^{97} + \beta_{98} D_{it}^{98} + \beta_{99} D_{it}^{99} + \beta_{100} D_{it}^{100} + \epsilon_{it}$

#### 4. Results and Discussion

As context for estimating equation (1), Figure 2a plots the logpoint difference between the price of Corn Belt MOP and the price of Brazil MOP, as well as the difference between the Corn Belt (granular MOP) and Southeast Asia (standard MOP) prices. Figure 2b plots the difference between Corn Belt MOP and nitrogen (urea) and phosphate (DAP) prices. For each of the available control markets, the figures generally do not show an increase in the price difference – the dependent variable in equation (1) – after the merger closed in January 2018. The only exception is that the difference relative to DAP increases in 2019, but as seen in Figure 1 this is more an artifact of declining DAP prices than increasing

## 5. Conclusion

In its review of the Agrium/PotashCorp merger the FTC had to evaluate whether a substantial increase in the concentration of North American potash capacity would hurt US farmers and consumers. Aggressive intervention could have wide-ranging impacts. USDA estimates that agriculture and related industries accounted for 5.4 percent of U.S. gross domestic product in 2017, and 11 percent of employment.<sup>30</sup> Ultimately, while the Federal Trade Commission required divestitures related to nitrogen and phosphate, it placed no restrictions on the firm's consolidation of 60 percent of North American potash production capacity. Especially in light of a history of export cartel behavior, this combination of potash producers may have been close to the enforcement margin. Retrospective analysis of potential

---

---

---

would be on the merger's labor market effects. The control variable used in this study is the average Saskatchewan wage for all
